Multiple Processor Systems for Real-time Applications Burt H. Liebowitz,John Hargadine Carson,1985

Multi-Processor System-on-Chip 1 Liliana Andrade,Frederic Rousseau,2021-05-11 A Multi Processor System on Chip MPSoC is the key component for complex applications These applications put huge pressure on memory communication devices and computing units This book presented in two volumes Architectures and Applications therefore celebrates the 20th anniversary of MPSoC an interdisciplinary forum that focuses on multi core and multi processor hardware and software systems It is this interdisciplinarity which has led to MPSoC bringing together experts in these fields from around the world over the last two decades Multi Processor System on Chip 1 covers the key components of MPSoC processors memory interconnect and interfaces It describes advance features of these components and technologies to build efficient MPSoC architectures All the main components are detailed use of memory and their technology communication support and consistency and specific processor architectures for general purposes or for dedicated applications **Electronic System-Level HW/SW Co-Design of Heterogeneous Multi-Processor Embedded Systems** Luigi Pomante,2022-09-01 Modern electronic systems consist of a fairly heterogeneous set of components Today a single system can be constituted by a hardware platform frequently composed of a mix of analog and digital components and by several software application layers The hardware can include several heterogeneous microprocessors e g GPP DSP GPU etc dedicated ICs ASICs and or FPGAs memories a set of local connections between the system components and some interfaces between the system and the environment sensors actuators etc Therefore on the one hand multi processor embedded systems are capable of meeting the demand of processing power and flexibility of complex applications On the other hand such systems are very complex to design and optimize so that the design methodology plays a major role in determining the success of the products For these reasons to cope with the increasing system complexity the approaches typically used today are oriented towards co design methodologies working at the higher levels of abstraction Unfortunately such methodologies are typically customized for the specific application suffer of a lack of generality and still need a considerable effort when real size project are envisioned Therefore there is still the need for a general methodology able to support the designer during the high level steps of a co design flow enabling an effective design space exploration before tackling the low level steps and thus committing to the final technology This should prevent costly redesign loops In such a context the work described in this book composed of two parts aims at providing models methodologies and tools to support each step of the co design flow of embedded systems implemented by exploiting heterogeneous multi processor architectures mapped on distributed systems as well as fully integrated onto a single chip Scientific and Technical Aerospace Reports ,1994 **Tutorial Hard Real-time Systems** John A. Stankovic,Krithi Ramamritham,1988 **Digital Computer Applications to Process Control** M. Paul,2016-11-04 Considers the application of modern control engineering on digital computers with a view to improving productivity and

product quality easing supervision of industrial processes and reducing energy consumption and pollution The topics covered may be divided into two main subject areas 1 applications of digital control in the chemical and oil industries in water turbines energy and power systems robotics and manufacturing cement metallurgical processes traffic control heating and cooling 2 systems theoretical aspects of digital control adaptive systems control aspects multivariable systems optimization and reliability modelling and identification real time software and languages distributed systems and data networks Contains 84 papers   *Proceedings of the IEEE Workshop on Real-Time Applications* ,1993   *Program Solicitation* ,2001

Multi-Microprocessor Systems for Real-Time Applications Gianni Conte,Dante del Corso,2012-12-06 The continous development of computer technology supported by the VLSI revolution stimulated the research in the field of multiprocessors systems The main motivation for the migration of design efforts from conventional architectures towards multiprocessor ones is the possibi I ity to obtain a significant processing power together with the improvement of price performance reliability and flexibility figures Currently such systems are moving from research laboratories to real field appl ications Future technological advances and new generations of components are I ikely to further enhance this trend This book is intended to provide basic concepts and design methodologies for engineers and researchers involved in the development of mul tiprocessor systems and or of appl ications based on multiprocessor architectures In addition the book can be a source of material for computer architecture courses at graduate level A preliminary knowledge of computer architecture and logical design has been assumed in wri ting this book Not all the problems related with the development of multiprocessor systems are addressed in th i s book The covered range spans from the electrical and logical design problems to architectural issues to design methodologis for system software Subj ects such as software development in a multiprocessor environment or loosely coupled multiprocessor systems are out of the scope of the book Since the basic elements processors and memories are now available as standard integrated circuits the key design problem is how to put them together in an efficient and reliable way **Mini- and Microcomputers and Their Applications** M.
