Response Strategies and Individual Differences in Multiple-Task Performance Diane L. Damos,Thomas E. Smith,STATE UNIV OF NEW YORK AT BUFFALO AMHERST DEPT OF INDUSTRIAL ENGINEERING.,1981 Three experiments examining individual differences in multiple task performance are presented Experiment I examined whether the response strategies used to perform two discrete information processing tasks reflected individual differences in information processing at high levels of workload or simply were selected at random Each subject's response strategy first was identified as either a simultaneous an alternating or a massed strategy Then some of the subjects were asked to change strategy The results indicated that the massed response strategy subjects had less well developed timesharing skills and were not able to process information under multiple task conditions as well as the other subjects regardless of the response strategy used The results were interpreted as evidence that response strategies represent fundamental differences in multiple task information processing Experiments II and III attempted to locate the source of the differences observed in Experiment I Experiment II examined the relation between multiple task performance in two different task combinations and cerebral lateralization in multiple limb coordination and four tests of cognitive style No significant relations were found

*Multiple-Task Performance: A Critical Review of the Literature and a Cognitive Neuroscience Framework* J. E. Korteling,PRINS MAURITS LABORATORIUM TNO RIJSWIJK(Netherlands),1994 In our modern society technological developments have altered the nature of jobs and tasks In many work situations operators are required to monitor control and manipulate information via complex technological systems Such systems typically involve performance of several tasks in a limited period of time In order to be able to optimize such technological systems knowledge with regard to complex task performance is needed based on which technical products processes and systems involved in daily life can be matched to the capabilities and limitations of people

Multitasking: Executive Functioning in Dual-Task and Task Switching Situations Tilo Strobach, Mike Wendt, Markus Janczyk,2018-03-27 Multitasking refers to performance of multiple tasks The most prominent types of multitasking are situations including either temporal overlap of the execution of multiple tasks i e dual tasking or executing multiple tasks in varying sequences i e task switching In the literature numerous attempts have aimed at theorizing about the specific characteristics of executive functions that

control interference between simultaneously and or sequentially active component of task sets in these situations However these approaches have been rather vague regarding explanatory concepts e g task set inhibition preparation shielding capacity limitation widely lacking theories on detailed mechanisms and or empirical evidence for specific subcomponents The present research topic aims at providing a selection of contributions on the details of executive functioning in dual task and task switching situations The contributions specify these executive functions by focusing on 1 fractionating assumed mechanisms into constituent subcomponents 2 their variations by age or in clinical subpopulations and or 3 their plasticity as a response to practice and training

Smist,STATE UNIV OF NEW YORK AT BUFFALO AMHERST DEPT OF INDUSTRIAL ENGINEERING.,1980 Eleven right handed males participated in an experiment examining individual differences in multiple task performance Three task combinations were used in the study The first was composed of a memory task and a classification task The second consisted of two identical one dimensional compensatory tracking tasks The third was a dichotic listening task On Day 1 of the experiment the subjects practiced each task alone On Days 2 3 and 4 they performed primarily under dual task conditions However periodically dual task practice was interrupted to reassess single task performance All dual task data were analyzed first to determine when stability occurred Each subject s stabilized data from the tracking tracking and memory classification combinations then were corrected for the appropriate single task baseline Finally the subjects were grouped according to which of three response strategies they used to perform the memory classification task combination These strategies were a massed strategy in which the subject would emit a series of response to one task before responding to the other an alternating responses strategy and a simultaneous response strategy A two way repeated measures MANOVA conducted on the stabilized adjusted data indicated both a significant effect of trials and groups Possible sources of the between group differences are discussed Author **A Composite Model of Multiple-task Performance** Rainer Wieland-Eckelmann,1992

Annual Meeting of the Academy of Management Academy of Management,1996 **A Computational Theory of Executive Cognitive Processes and Human Multiple-Task Performance. Part 1. Basic Mechanisms** ,1996 Persistent controversies about human multiple task performance suggest that research on it will benefit from increased use of precise computational models Toward this objective the present report outlines a comprehensive theoretical framework for understanding and predicting the performance of concurrent perceptual motor and cognitive tasks The framework involves an Executive Process Interactive Control EPIC architecture which has component modules that process information at

perceptual cognitive and motor levels On the basis of EPIC computational models that use a production system formalism may be constructed to simulate multiple task performance under a variety of conditions These models account well for reaction time data from representative paradigms such as the psychological refractory period PRP procedure With modest numbers of parameters good fits between empirical and simulated reaction times support several key conclusions 1 at a cognitive level people can apply distinct sets of production rules simultaneously for executing the procedures of multiple tasks 2 there is no immutable central response selection or decision bottleneck 3 people s capacity to process information and take action at peripheral perceptual motor levels is limited 4 to cope with such limits and to satisfy task priorities flexible scheduling strategies are used 5 these strategies are mediated by executive cognitive processes that coordinate concurrent tasks adaptively The initial success of EPIC and models based on it suggest that they may help characterize multiple task performance across many domains including ones that have substantial practical relevance
