

Advantages of Multiprocessors (Parallel Processors)

1. Create **powerful computers** by simply connecting multiple processors.
2. A multiprocessor is expected to reach **faster speed** than the fastest single-processor system.
3. A multiprocessor consisting of a number of single processors is expected to be more **cost-effective** than building a high-performance single processor.
4. A multiprocessor is **fault tolerance**. If a processor fails, the remaining processors should be able to provide continued service.

Single Processor System

VS

Multi Processor System

Parameter	Single Processor Systems	Multiprocessor Systems
Description	If a System contains only one processor for processing than it is called single processor system.	If a System contains two or more than two processors for processing than it is called multiprocessor system.
Speed	Speed of Single Processor Systems is less than Multiprocessor Systems Because each and every task is performed by the same processor.	Speed of Multiprocessor systems is greater than single processor systems.
Cost	Single Processor Systems cost more because each processor requires separate resources. i.e. Mass Storage, Power Supplies etc.	Multiprocessor Systems cost less than equivalent multiple single processor systems because they uses same resources on sharing basis.
Reliability	Less reliable because failure in one processor will result in failure of entire system.	More reliable because failure of one processor does not halt the entire system but only speed will be slow down.
