Topics Harry Dym, Marinus A. Kaashoek, Peter Lancaster, Heinz Langer, Leonid Lerer, 2012-02-01 This book is dedicated to the memory of Israel Gohberg 1928 2009 one of the great mathematicians of our time who inspired innumerable fellow mathematicians and directed many students The volume reflects the wide spectrum of Gohberg's mathematical interests It consists of more than 25 invited and peer reviewed original research papers written by his former students co authors and friends Included are contributions to single and multivariable operator theory commutative and non commutative Banach algebra theory the theory of matrix polynomials and analytic vector valued functions several variable complex function theory and the theory of structured matrices and operators Also treated are canonical differential systems interpolation completion and extension problems numerical linear algebra and mathematical systems theory *Operator Theory, Operator Algebras and Their Interactions with Geometry and Topology* Raul E Curto, William Helton, Huaxin Lin, Xiang Tang, Rongwei

Yang, Guoliang Yu, 2020-12-12 This book is the proceeding of the International Workshop on Operator Theory and Applications IWOTA held in July 2018 in Shanghai China It consists of original papers surveys and expository articles in the broad areas of operator theory operator algebras and noncommutative topology Its goal is to give graduate students and researchers a relatively comprehensive overview of the current status of research in the relevant fields The book is also a special volume dedicated to the memory of Ronald G Douglas who passed away on February 27 2018 at the age of 79 Many of the contributors are Douglas students and past collaborators Their articles attest and commemorate his life long contribution and influence to these fields **Mutual Impact of Computing Power and Control Theory** M. Kárny, K.

Warwick, 2012-12-06 Recent rapid developments in computing power such as parallel processing and neural networks have stimulated new trends in control However a discrepancy exists between available computing power and exploitable algorithms obtained classically from control theory The aim of this book is to address the discrepancy from both the computational power and control theory viewpoints Areas such as identification adaptive control signal processing and neural networks therefore hold a prominent position in the text presented The form of the book is such that it should be useful for readers at various levels particularly those at the research and or application stage The book has resulted from the IFAC Workshop on the Mutual Impact of Computing Power and Control Theory which was held at the Institute of Information Theory and Automation UTIA Prague in September 1992 Organisation of the event was provided jointly by the Department of Adaptive Systems UTIA Prague and the School of Engineering and Information Sciences University of Reading UK Selected

papers from the Workshop have been chosen to give a good balance across the field whilst at the same time highlighting important areas for future research. In this way the book represents edited Proceedings from the Workshop. One point quickly apparent is the international nature of the presentations themselves which provide not only a technical appraisal of the field but also inject cultural aspects which are vitally important on the path ahead.

Linear Algebra for Control Theory Paul Van Dooren, Bostwick Wyman, 2012-12-06. During the past decade the interaction between control theory and linear algebra has been ever increasing giving rise to new results in both areas. As a natural outflow of this research this book presents information on this interdisciplinary area. The cross fertilization between control and linear algebra can be found in subfields such as Numerical Linear Algebra, Canonical Forms, Ring theoretic Methods, Matrix Theory and Robust Control. This book's editors were challenged to present the latest results in these areas and to find points of common interest. This volume reflects very nicely the interaction; the range of topics seems very wide indeed but the basic problems and techniques are always closely connected. And the common denominator in all of this is of course linear algebra. This book is suitable for both mathematicians and students.

Proceedings of the Cornelius Lanczos International Centenary Conference J. David Brown, 1994-01-01. *Numerical Linear Algebra in Signals, Systems and Control* Paul Van Dooren, Shankar P. Bhattacharyya, Raymond H. Chan, Vadim Olshevsky, Aurobinda Routray, 2011-05-21. The purpose of *Numerical Linear Algebra in Signals Systems and Control* is to present an interdisciplinary book blending linear and numerical linear algebra with three major areas of electrical engineering: Signal and Image Processing and Control Systems and Circuit Theory. *Numerical Linear Algebra in Signals Systems and Control* will contain articles both the state of the art surveys and technical papers on theory, computations and applications addressing significant new developments in these areas. The goal of the volume is to provide authoritative and accessible accounts of the fast paced developments in computational mathematics, scientific computing and computational engineering methods, applications and algorithms. The state of the art surveys will benefit in particular beginning researchers, graduate students and those contemplating to start a new direction of research in these areas. A more general goal is to foster effective communications and exchange of information between various scientific and engineering communities with mutual interests in concepts, computations and workable, reliable practices.

Recent Advances in Operator Theory A. Dijksma, Marinus A. Kaashoek, A.C.M. Ran, 2012-12-06. This volume contains a selection of papers in modern operator theory and its applications. Most of them are directly related to lectures presented at the International Workshop on Operator Theory and its Applications held at the University of Groningen (IWOTA 98) in Groningen, the Netherlands from June 30 to July 3, 1998. The workshop was attended by 97 mathematicians of which 12 were PhD or postdoctoral students from 19 countries. The program consisted of 19 plenary lectures of 40 minutes and 72 lectures of 30 minutes in 4 parallel sessions. The present volume reflects the wide range and rich variety of topics presented and discussed at the workshop. The papers deal with operator polynomials and analytic operator functions with spectral problems of partial

differential operators and related operator matrices with interpolation completion and extension problems with commutant lifting and dilation with Riccati equations and realization problems with scattering theory with problems from harmonic analysis and with topics in the theory of reproducing kernel spaces and of spaces with an indefinite metric All papers underwent the usual refereeing process

Model Order Reduction: Theory, Research Aspects and Applications Wilhelmus H. Schilders, Henk A. van der Vorst, Joost Rommes, 2008-08-27 The idea for this book originated during the workshop Model order reduction coupled problems and optimization held at the Lorentz Center in Leiden from September 19-23 2005 During one of the discussion sessions it became clear that a book describing the state of the art in model order reduction starting from the very basics and containing an overview of all relevant techniques would be of great use for students young researchers starting in the field and experienced researchers The observation that most of the theory on model order reduction is scattered over many good papers making it difficult to find a good starting point was supported by most of the participants Moreover most of the speakers at the workshop were willing to contribute to the book that is now in front of you The goal of this book as defined during the discussion sessions at the workshop is three fold first it should describe the basics of model order reduction Second both general and more specialized model order reduction techniques for linear and nonlinear systems should be covered including the use of several related numerical techniques Third the use of model order reduction techniques in practical applications and current research aspects should be discussed We have organized the book according to these goals In Part I the rationale behind model order reduction is explained and an overview of the most common methods is described

Algorithms and Parallel VLSI Architectures II Patrice Quinton, Yves Robert, 1992 Since the emergence of VLSI the relationship between the development of parallel algorithms and the design of special purpose architecture has always been of major concern The analysis of this relationship is the main topic of this book Hardware and software issues closely depend upon one another and cannot be solved independently Beyond the natural complexity of algorithm design the designer has to face that of choosing the appropriate technology medium for its efficient realization The dramatic developments in VLSI technology now offers extraordinary opportunities for implementing complex applications As application specific systems can offer 100 to 1000 fold improvements in cost performance over general purpose computers on applications they are attracting increasing attention in both academic and industrial communities Highly specialized application specific arrays of processors which are the targeted architectures in
