

# Signs of Life on Mars

When we talk about searching for signs of ancient life on Mars, what we are actually looking for is a biosignature: an object, substance, or pattern that could only have been made by life. There are 6 specific kinds of biosignatures that we might encounter on Mars:

## ORGANICS

Organic compounds contain carbon and hydrogen and other light elements. All life on Earth is made of organic compounds, but organic compounds also form in the absence of life. Systematic patterns in the types of organic matter could be a biosignature.

## ISOTOPES

Atoms of one chemical element always contain the same number of protons but can have differing numbers of neutrons. On Earth, biological processes sometimes prefer one isotope over another, and that preference can be preserved in rocks.

## MINERALS

On Earth, some minerals are uniquely associated with life. Discovery of a mineral that requires life to form would be a biosignature.

## CHEMICALS

Earth-life metabolic activity often has a chemical signature. Signs of varying pH or oxidation state over very small scales might be the signature of microbial metabolism in an ancient environment.

## SMALL-SCALE STRUCTURES

At the microscopic level, it's possible to spot signs of individual microscopic life forms: fossilized cells, or molds of cells, or casts of cells.

## LARGE-SCALE STRUCTURES

At the macroscopic level, microbes on Earth build mats, stromatolites, reefs, and other structures.

On Earth, geologists look for biosignatures in ancient rocks to learn when life originated. The record for oldest evidence for Earth life is from stromatolites in the Pilbara region of Australia. They show mineral, chemical, and structural evidence for the presence of life on Earth 3.5 billion years ago. The more different kinds of biosignatures observed, the more confident we can be in the conclusion that life was present.

**ABOVE** A 3.7 billion year-old fossil stromatolite from western Australia preserves some of the oldest evidence for life on Earth.
