Real-Time UNIX® Systems Borko Furht, Dan Grostick, David Gluch, Guy Rabbat, John Parker, Meg McRoberts, 2012-09-28 A growing concern of mine has been the unrealistic expectations for new computer related technologies introduced into all kinds of organizations Unrealistic expectations lead to disappointment and a schizophrenic approach to the introduction of new technologies The UNIX and real time UNIX operating system technologies are major examples of emerging technologies with great potential benefits but unrealistic expectations Users want to use UNIX as a common operating system throughout large segments of their organizations A common operating system would decrease software costs by helping to provide portability and interoperability between computer systems in today s multivendor environments Users would be able to more easily purchase new equipment and technologies and cost effectively reuse their applications And they could more easily connect heterogeneous equipment in different departments without having to constantly write and rewrite interfaces On the other hand many users in various organizations do not understand the ramifications of general purpose versus real time UNIX Users tend to think of real time as a way to handle exotic heart monitoring or robotics systems Then these users use UNIX for transaction processing and office applications and complain about its performance robustness and reliability Unfortunately the users don t realize that real time capabilities added to UNIX can provide better performance robustness and reliability for these non real time applications Many other vendors and users do realize this however There are indications even now that general purpose UNIX will go away as a separate entity It will be replaced by a real time UNIX General purpose UNIX will exist only as a subset of real time UNIX

Real-Time Programming 1992 J.A. De La Puente,L. Boullart,2017-02-21 The 47 papers in this volume provide a useful reference tool for the state of the art research in real time programming **Operating Systems and Services** Ragunathan Rajkumar,1999-08-31 Operating Systems and Services brings together in one place important contributions and up to date research results in this fast moving area Operating Systems and Services serves as an excellent reference providing insight into some of the most challenging research issues in the field Imprecise and Approximate Computation Swaminathan Natarajan,2007-08-26 Real time systems are now used in a wide variety of applications Conventionally they were configured at design to perform a given set of tasks and could not readily adapt to dynamic situations The concept of imprecise and approximate computation has emerged as a promising approach to providing scheduling flexibility and enhanced dependability in dynamic real time systems The concept can be utilized in a wide variety of applications including signal processing machine vision databases networking etc For those who wish to build dynamic real time systems which must deal safely with resource unavailability while continuing to operate leading to situations where computations may not be carried through to completion the techniques of imprecise and approximate computation facilitate the generation of partial results that may enable the system to operate safely and avert catastrophe Audience Of special interest to researchers May be used as a supplementary text in courses on real time systems **Distributed Computer Control Systems 1995** A.E.K. Sahraoui,J.A. de la Puente,2014-05-23 The series of IFAC Workshops on distributed computer control systems DCCS provide the opportunity for leading researchers and practitioners in the field to discuss and evaluate recent advances and current issues in theory applications and technology of DCCS DCCS 95 the 13th IFAC workshop in the series was held in Toulouse Blagnac France The topics covered at this meeting included the role of real time in DCCS specifications scheduling methods for DCCS real time distributed operating systems and databases and industrial applications and experience with DCSS

Distributed Systems for System Architects Paulo Veríssimo,Luís Rodrigues,2012-12-06 The primary audience for this book are advanced undergraduate students and graduate students Computer architecture as it happened in other fields such as electronics evolved from the small to the large that is it left the realm of low level hardware constructs and gained new dimensions as distributed systems became the keyword for system implementation As such the system architect today assembles pieces of hardware that are at least as large as a computer or a network router or a LAN hub and assigns pieces of software that are self contained such as client or server programs Java applets or protocol modules to those hardware components The freedom she he now has is tremendously challenging The problems alas have increased too What was before mastered and tested carefully before a fully fledged mainframe or a closely coupled computer cluster came out on the market is today left to the responsibility of computer engineers and scientists invested in the role of system architects who fulfil this

role on behalf of software vendors and integrators add value system developers R D institutes and final users As system complexity size and diversity grow so increases the probability of inconsistency unreliability non responsiveness and insecurity not to mention the management overhead What System Architects Need to Know The insight such an architect must have includes but goes well beyond the functional properties of distributed systems Real-time Systems Design and Analysis Phillip A. which lie embedded real time systems Military defense systems deployed in the air on the ocean surface land and underwater have also been increasingly relying upon real time systems for monitoring and operational safety purposes and for retaliatory and containment measures In telecommunications and in multi media applications real time characteristics are essential to maintain the integrity of transmitted data audio and video signals Many of these systems control monitor or perform critical operations and must respond quickly to emergency events in a wide range of embedded applications They are therefore required to process tasks with stringent timing requirements and must perform these tasks in a way that these timing requirements are guaranteed to be met Real time scheduling algorithms attempt to ensure that system timing behavior meets its specifications but typically assume that tasks do not share logical or physical resources Since resource sharing cannot be eliminated synchronization primitives must be used to ensure that resource consistency constraints are not violated
