,2012 TRB's National Cooperative Highway Research Program NCHRP Report 725 Guidelines for Analysis Methods and Construction Engineering of Curved and Skewed Steel Girder Bridges offers guidance on the appropriate level of analysis needed to determine the constructability and constructed geometry of curved and skewed steel girder bridges When appropriate in lieu of a 3D analysis the guidelines also introduce improvements to 1D and 2D analyses that require little additional computational costs Publication information **New Frontiers in Light Metals** Laurens Katgerman, Frans Soetens, 2010 Held at the Auditorium of the Eindhoven University of Technology Eindhoven the Netherlands on 23-25 June 2010 t p **Research and Applications in Structural Engineering, Mechanics and Computation** Alphonse Zingoni, 2013-08-15 Research and Applications in Structural Engineering Mechanics and Computation contains the Proceedings of the Fifth International Conference on Structural Engineering Mechanics and Computation SEMC 2013 Cape Town South Africa 2-4 September 2013 Over 420 papers are featured Many topics are covered but the contributions may be seen to fall *Cross-frame Diaphragm Bracing of Steel Bridge Girders* W. M. Kim Roddis, 2008 Steel plate girder bridges make use of traditional cross frame diaphragms to stabilize the compression flange of girders These braces are required during construction especially during deck placement to prevent lateral torsional buckling of bridge girders Girder buckling capacity is a function of cross frame diaphragm spacing as well as strength and stiffness Recent developments in bridge design may cause the governing girder limit state to shift from one of strength to one of stability These developments include the elimination of in plan bracing composite girders High Performance Steels and phased deck replacements In addition the American Association of State Highway and Transportation Officials AASHTO has changed its code requirement for cross frame diaphragm spacing in the 1998 AASHTO LRFD Bridge Design Specifications The requirement for 25 foot maximum brace spacing has been removed The current requirement is for a rational analysis to determine cross frame diaphragm spacing Explanations of the problems these changes cause in design are discussed A case study is presented of a bridge that suffered construction difficulties during deck placement This investigation found that the cross frame diaphragms were not stiff enough to brace the plate girders during the deck placement Suggestions are given as to an efficient economical design and spacing for cross frame diaphragms on plate girder bridges **Behaviour of Steel Structures in Seismic Areas** Federico Mazzolani, Ricardo Herrera, 2012-01-31 Behaviour of Steel Structures in Seismic Areas is a comprehensive overview of recent developments in the field of seismic resistant steel structures It comprises a collection of papers presented at the seventh International Specialty Conference STESSA 2012 Santiago Chile 9-11 January 2012 and includes the state of the art in both theory *Investigation of a Deployable Military Bridge System with a Fiberglass Reinforced Concrete Deck* Joseph Patrick Hanus, 2007 **Proceedings** Structural Stability Research Council. *Stability Sensitivity of Low-rise Steel-moment Framed Buildings to Hazard-independent Damage* Trey Reynolds Powell, 2016 Structural stability has been the subject of much research in recent years Simply structural stability may be viewed as the ability of the structure's response to be relatively unaffected by perturbations to its system Stability of low rise steel moment framed buildings and their sensitivity to perturbations from significant damage are the focus of this work Perturbations or changes from the normal state of the structural system have the ability to affect the structural response Second order geometric effects imposed through column axial loads and or initial out of plumbness during the construction process are a common perturbation in steel framing systems If the structural members subjected to these effects are damaged through a specific hazard the effective stiffnesses of the members are reduced and the consequence of the individual perturbations is amplified Because such scenarios are feasible during the lifetime of a structure robust methods to investigate structural stability sensitivity to damage and second order geometric effects are desired A stiffness reduction factor is introduced into the analytical finite element formulation of a portal frame to account for hazard independent damage Second order geometric effects are included in this formulation This finite element formulation is created using Mathematica and its formulation is verified against idealized elastic critical buckling load theory Next the formulation is generalized to provide an ability to analyze the elastic buckling load of a wide range of portal frames The finite element software MASTAN2 and SAP2000 are utilized for verification purposes ABAQUS CAE is chosen to further examine the stability of steel moment frames Several cases of gravity and lateral loads are applied to planar frame models Again the hazard independent damage is introduced to the system in various cases and nonlinear geometric effects are accounted for Results of this study suggest that the response is largely impacted by the amount and location of the hazard independent damage as well as the complexity of the frame system Lastly the study is extended to a three dimensional steel frame system The system is once again perturbed by several cases of nonlinear geometric effects and hazard independent damage Results of this study suggest that stability failure is a high concern in the cases considered
