Programming Language Structures Elliott I. Organick, Alexandra I. Forsythe, Robert P. Plummer, 2014-05-10 Programming Language Structures deals with the structures of programming languages and introduces the reader to five important programming languages Algol Fortran Lisp Snobol and Pascal The fundamental similarities and differences among these languages are discussed A unifying framework is constructed that can be used to study the structure of other languages such as Cobol PL I and APL Several of the tools and methodologies needed to construct large programs are also considered Comprised of 10 chapters this book begins with a summary of the relevant concepts and principles about algorithms flowcharts and computation that a student is expected to know from the first course The discussion then turns to the semantics of procedure and function call as well as argument parameter matching with various kinds of parameters recursion and its relation to tree traversal syntax formalism for context free languages and ALGOL 60 and block structuring Case study programs are presented to reinforce the reader s understanding of ALGOL 60 and Fortran semantics The remaining chapters deal with Lisp Snobol and Pascal This monograph is intended for working programmers and students in computer science who have an interest in the subject of programming

Automatic Coding: Choice of Data Structures

LOW, 2013-12-20 1 0 2 information structures and the runtime efficiency available using lower level data structures We believe these runtime inefficiencies can be remedied by providing a library of representations for the information structures and a user assisted automatic system to choose appropriate elements from this library for the user s programs The main problems in such an automatic approach are 1 Building a library of representations 2 Characterizing the properties of these representations 3 understanding how the user s program actually uses the abstract information structures and 4 efficiently matching the user program needs with the properties of the known representations The research reported here is an attempt to demonstrate the feasibility of such automatic representation selection We allow the user to express data in terms of relations sets and sequences Our system then obtains information by analysis of the program execution statement profiles and interrogation of the user Using that information the system selects efficient in terms of time and space low level implementations for the user s information structures from a fixed library of information structure representations Though we have considered only a few abstract information structures those available in our programming language SAIL we believe the techniques used in this system are generally applicable

Psychology of Programming J.-M. Hoc, 2014-05-19 Psychology provides a backdrop for most of the study of human b1computer interaction In this volume the psychological issues that pertain to programming rather than systems design are examined in four sections Theoretical and Methodological Issues Language Design and Skill Acquisition Expert Programming and the Future The book was inspired by working groups in France and the United Kingdom but also includes work by major North American figures such as Curtis and Soloway It is the first comprehensive work on this topic since the early 1980s

Programming Languages, a Grand Tour Ellis Horowitz,1987 *Software Programming Languages* *The Essence of Rum: a Theory of the Intensional and Extensional Aspects of Lisp-type Computation* Carolyn L. Talcott,Stanford University. Computer Science Department,1985 Rum is a theory of applicative side effect free computations over an algebraic data structure It goes beyond a theory of functions computed by programs treating both intensional and extensional aspects of computation Powerful programming tools such as streams object oriented programming escape mechanisms and co routines can be represented Intensional properties include the number of multiplications executed the number of context switches and the maximum stack depth required in a computation Extensional properties include notions of equality for streams and co routines and characterization of functionals implementing strategies for searching tree structured spaces Precise definitions of informal concepts such as stream and co routine are given and their mathematical theory is developed Operations on programs treated include program transformations which introduce functional and control abstractions a compiling morphism that provides a representation of control abstractions as functional abstractions and operations that transform intensional properties to extensional properties The goal is not only to account for programming practice in Lisp but also to improve practice by providing mathematical tools for developing programs and building programming systems Rum views computation as a process of generating computation structures trees for context independent computations and sequences for context dependent computations The recursion theorem gives a fixed point function that computes computationally minimal fixed points The context insensitivity theorem says that context dependent computations are uniformly parameterized by the calling context and that computations in which context dependence is localized can be treated like context independent computations

Design of Very High-level Computer Languages Melvin Klerer,1991 In this fascinating book Melvin Klerer identifies user oriented computer languages which are keyed to the language and notation of the specific scientist engineer or mathematician using it This language is so easily understood that users can write and interact with programs without the aid of programmers
