

Chapter 2: Mathematics as a Tool (Part I)

Overview

The field of statistics is the science of learning from data. Statistical knowledge helps you use the proper methods to collect the data, employ analyses, and effectively present the results. Statistics is a crucial process behind how we make discoveries in science, make decisions based on data, and make predictions. Statistics allows you to understand a subject much more deeply.

In performing all these processes involved, the application of statistical tools and techniques is necessary. Statistical tools derived from mathematics are useful in processing and managing numerical data in order to describe a phenomenon and predict values.

General Objectives:

This chapter emphasize the use of different statistical tools to process and manage numerical data.

Lesson 1: Data Management

Data come in different forms and from different sources. You read them in a daily newspaper, hear them over the radio, see them on television, and find them on the internet. We have great quantities of data related to sports, business, education, traffic, law enforcement, and hundreds of some other human activities. These vast data are made available to assist us in our decision-making. If these data are not properly managed and analyzed, everything will be meaningless and void or lead us to false and unreliable information.

Specific objectives:

At the end of this lesson, the students are expected to:

1. Organize and present data in forms that are both meaningful and useful to decision makers;
2. Use a variety of statistical tools to process and manage numerical data;
3. Use the methods of linear regression and correlation to predict the value of a variable given certain conditions; and
4. Advocate the use of statistical data in making important decisions.

The New Statistical Analysis of Data T.W. Anderson, Jeremy D. Finn, 2012-12-06 The Nature of the Book This book is a text for a first course in statistical concepts and methods It introduces the analysis of data and statistical inference and explains various methods in enough detail so that the student can apply them Little mathematical background is required only high school algebra is used No mathematical proof is given in the body of the text although algebraic demonstrations are given in appendices at the ends of some chapters The exposition is based on logic verbal explanations figures and numerical examples The verbal and conceptual levels are higher than the mathematical level The concepts and methods of statistical analysis are illustrated by more than 100 interesting real life data sets Some examples are taken from daily life many deal with the behavioral sciences some with business the health sciences the physical sciences and engineering The exercises are of varying degrees of difficulty This book is suitable for undergraduates in many majors and for graduate students in the health sciences behavioral sciences and education It has grown out of our experience over many years of teaching such courses An earlier text by T W Anderson and S L Sclove *The Statistical Analysis of Data* had similar objectives and was of a similar nature *Basic Experimental Strategies and Data Analysis for Science and Engineering* John Lawson, John Erjavec, 2016-11-03 Every technical investigation involving trial and error experimentation embodies a strategy for deciding what experiments to perform when to quit and how to interpret the data This handbook presents several statistically derived strategies which are more efficient than any intuitive approach and will get the investigator to their goal with the fewest experiments give the greatest degree of reliability to their conclusions and keep the risk of overlooking something of practical importance to a minimum Features Provides a comprehensive desk reference on experimental design that will be useful to practitioners without extensive statistical knowledge Features a review of the necessary statistical prerequisites Presents a set of tables that allow readers to quickly access various experimental designs Includes a roadmap for where and when to use various experimental design strategies Shows compelling examples of each method discussed Illustrates how to reproduce results using several popular software packages on a companion web site Following the outlines and examples in this book should quickly allow a working professional or student to select the appropriate experimental design for a research problem at hand follow the design to conduct the experiments and analyze and interpret the resulting data John Lawson and John Erjavec have a combined 25 years of industrial experience and over 40 years of academic experience They have taught this material to numerous practicing engineers and scientists as well as undergraduate and graduate students *Bayesian Data Analysis for the Behavioral and Neural Sciences* Todd E. and updated for the second edition Functional magnetic resonance imaging fMRI which allows researchers to observe neural activity in the human brain noninvasively has revolutionized the scientific study of the mind An fMRI experiment produces massive amounts of highly complex data for researchers to analyze This book describes all aspects of experimental design and data analysis for fMRI experiments covering every step from preprocessing to advanced methods for assessing functional connectivity as well as the most popular multivariate approaches The goal is not to describe which buttons to push in the popular software packages but to help researchers understand the basic underlying logic the assumptions the strengths and weaknesses and the appropriateness of each method The field of fMRI research has advanced dramatically in recent years in both methodology and technology and this second edition has been completely revised and updated Six new chapters cover experimental design functional connectivity analysis through the methods of psychophysiological interactions and beta series regression decoding using multi voxel pattern analysis dynamic causal modeling and representational similarity analysis Other chapters offer new material on recently discovered problems related to head movements the multivariate GLM meta analysis and other topics All complex derivations now appear at the end of the relevant chapter to improve readability A new appendix describes how to build a design matrix with effect coding for group analysis As in the first edition MATLAB code is provided with which readers can implement many of the methods described
