Dorresteijn, Wilfried Westheide, 2013-04-18 The fascination of the Annelida to scientists lies in the beauty of their structures and the functionality of their body plan the tremendous adaptive radiation which has made it possible for these animals to colonize almost all marine limnic and terrestrial biotopes In doing so they have evolved a great variety of life forms and their reproduction and development are correspondingly diverse with many modes and patterns unique in the animal kingdom In this special volume recent progress in this broad research area is presented by 26 specialists in general through surveys or treatments of selected examples Some of them review important annelid taxa such

as the Nereididae Syllidae Spionidae Cirratulidae Clitellata and Pogonophora others analyse reproductive and developmental structures and phenomena in annelids e g segmental organs sex pheromones oogenesis mating systems sperm types life cycles larval settlement cleavage and symmetry of embryos or discuss controversial approaches to annelid systematics The book will be of interest to all zoologists who work with annelids as well as to embryologists and other researchers in reproductive biology

**Annelids in Modern Biology** Daniel H. Shain, 2009-04-22 Annelids offer a diversity of experimentally accessible features making them a rich experimental subject across the biological sciences including evolutionary development neurosciences and stem cell research This volume introduces the Annelids and their utility in evolutionary developmental biology neurobiology and environmental ecological studies including extreme environments The book demonstrates the variety of fields in which Annelids are already proving to be a useful experimental system Describing the utility of Annelids as a research model this book is an invaluable resource for all researchers in the field

**Annelida Basal Groups and Pleistoannelida, Sedentaria I** Günter Purschke, Markus Böggemann, Andreas Schmidt-Rhaesa, Wilfried Westheide, 2019-03-18 This book is the first in a series of 4 volumes in the Handbook of Zoology series about morphology anatomy reproduction development ecology phylogeny and systematics of Annelida This first volume covers members of the so called basal radiation and the first part of Sedentaria It is supplemented by chapters on the history of annelid research their fossil record and an introduction to the phylogeny of annelids and their position in the tree of life In the latter chapter the history of their systematic is reviewed giving an almost complete picture of systematic scientific

progress especially in the past years which changed our view on annelid phylogeny dramatically The most basal annelids lately united as Palaeoannelida represent two families of aberrant polychaetes formerly often suggested to be highly derived which now give us a fresh look on how the ancestral annelid may have looked like These lack certain key characters such as nuchal organs and possess rather simple nervous systems which now likely represent primitive character states In this basal radiation the first taxon of apparently unsegmented and achaetigerous animals is positioned the Sipuncula Most likely another group of platyhelminth like and unsegmented and even chaeta less annelids Lobatocerebridae falls into this basal radiation The section of Sedentaria starts with Orbiniida a taxon characterized by elongated thread like worms which do not have anterior appendages like palps and comprises several families representing members of the Meiofauna These minute worms often inhabiting the interstitial spaces in marine sands are suggested to have evolved by progenesis The second higher taxon is represented by Cirratuliformia comprising nine families of typical sedentary polychaetes each of which showing a remarkable variation of the annelid body plan Members of this taxon usually exhibit many annelid characters but certain also lack the most typical prostomial appendages the palps

Emerging Model Systems in Developmental Biology, 2022-03-23 An ever growing roster of model organisms is a hallmark of 21st century Developmental Biology Emerging model organisms are well suited to asking some fascinating and important questions that cannot be addressed using established model systems And new methods are increasingly facilitating the adoption of new research organisms in laboratories This volume is written by some of the scientists who have played pivotal roles in developing new models or in significantly advancing tools in emerging systems Presents some of the most interesting additions to the core set of model organisms Contains contributions from people who have developed new model systems or advanced tools Includes personal stories about how and why model systems were developed

*Pleistoannelida, Sedentaria II* Günter Purschke, Markus Böggemann, Andreas Schmidt-Rhaesa, Wilfried Westheide, 2020-02-24 This book is the second volume in a series of 4 volumes in the Handbook of Zoology series treating morphology anatomy reproduction development ecology phylogeny systematics and taxonomy of polychaetous Annelida In this volume a comprehensive review of a few more derived higher taxa within Sedentaria are given namely Sabellida Opheliida Capitellida as well as Hrabieillidae The former comprise annelids possessing a body divided into two more or less distinct regions or tagmata called thorax and abdomen Here two groups of families are united the spioniform and sabelliform polychaetes Especially Spionidae and Sabellidae are speciose families within this group and represent two of the largest annelid families These animals live in various types of burrows or tubes and all possess so called feeding palps In one group these appendages are differentiated as grooved feeding palps whereas in the other they may form highly elaborated circular tentacular crowns comprising a number of radioles mostly giving off numerous filamentous pinnulae Often additionally colourful the latter are also received the common names feather duster worms flowers of the sea Christmas tree worms Opheliida Capitellida including five families of truly worm like annelids

without appendages represents the contrary Their members burrow in soft bottom substrates and may be classified as non selective deposit feeders Molecular phylogenetic analyses have shown that Echiura or spoon worms formerly regarded to represent a separate phylum are members of this group Last not least Hrabeiellidae is one out of only two families of oligochaete like terrestrial polychaetes and for this reason received strong scientific interest

**Coastal Plankton** Otto Larink, Wilfried Westheide, 2006 Each glance into a marine plankton sample is a look into a fantastic world for anyone who wants to study protists and invertebrate animals Nowhere is it possible to observe with a simple device such a variety of forms and taxa developmental stages and adaptations as in a Petri dish with a small plankton sample placed under a light microscope This book with more than 600 micro and 40 macrophotographs on 60 colour plates is an introduction to the most important and most common taxa present in the plankton and it allows the identification even of numerous common species 117 micrographs demonstrate characteristic forms of the phytoplankton 70 of protozoans more than 300 show larvae and other developmental stages and about 90 show holoplanktonic adults of the zooplankton The comprehensively annotated pictures are taken from living organisms during marine excursions mainly from the North Sea coastal area but also from other European coastlines including the western Mediterranean The book therefore is excellently suited to be used in such university courses for students of zoology and marine biology as well as for their teachers but it is certainly also a comprehensible guide for any amateur microscopist and interested layperson
