

# Physical Geography Study Guide

## Topics

### Active volcanoes and the Ring of Fire

The Ring of Fire is a horseshoe-shaped zone around the Pacific Ocean, containing a high concentration of active volcanoes and frequent earthquakes, resulting from tectonic plate boundaries and subduction zones.

- It includes countries like Japan, Indonesia, and the Philippines, showcasing diverse volcanic activity and hazards.
- Approximately 75% of the world's active and dormant volcanoes are located within the Ring of Fire.
- The Pacific Plate subducts under surrounding plates, causing intense geothermal activity.
- Notable volcanoes include Mount St. Helens, Mount Fuji, and Krakatoa, each with significant eruptions in history.

### Braided channels

Braided channels are river systems characterized by multiple intertwining streams that split and rejoin, forming a complex network of shallow, shifting waterways, typically occurring in areas with high sediment loads and variable water flow.

- They often form in flat, wide valleys where river gradients decrease, allowing sediment to accumulate.
- Braided channels are common in glacial rivers, where meltwater carries large amounts of sediments.
- The shifting nature of braided channels can create diverse habitats for aquatic and terrestrial species.
- Human activities, like damming and land use changes, can significantly alter the dynamics of braided river systems.

### Carbonation process affecting limestone

The carbonation process involves atmospheric carbon dioxide dissolving in rainwater, forming carbonic acid, which reacts with limestone, leading to its chemical weathering and formation of karst landscapes.

- Limestone is primarily composed of calcium carbonate, which reacts with carbonic acid during the carbonation process.
- The reaction produces calcium bicarbonate, which is soluble and can be easily washed away by water.
- Karst landscapes, defined by sinkholes and caves, result from prolonged limestone
