

THE MEASUREMENT OF ROUNDWOOD

METHODOLOGIES AND CONVERSION RATIOS

M.A. Fonseca,

United Nations Economic Commission for Europe,
Trade and Timber Branch, Geneva, Switzerland

For those that are involved in the trade, processing and harvest of roundwood, understanding volume determination, conversion ratios and product recovery is critical. This information is also important for government agencies such as forest services, trade organizations, statistical reporting entities and researchers.

This comprehensive volume provides hard-to-find information and instructions on the many methods by which roundwood and the products of roundwood are measured.

This includes: log scales and rules used in the world today; roundwood weight-to-volume averages and physical properties for more than 400 timber species found worldwide; general information on log grading, log manufacturing quality, sampling and extrapolation procedures and methods for determining log yard inventory and mill log usage volume. Finally, all facets of product recovery are presented with many detailed tables and graphs. The book will be invaluable for those in the forest and forest products industries, and will serve as a reference textbook for students of these disciplines.

"The author has done an admirable job of systematically summarizing a plethora of information on measuring roundwood. This comprehensive volume is sure to be invaluable to students and practitioners in forestry and forest products industries."

Harold E. Burkhart, Virginia Tech, USA
