technicians who must adapt and evolve as technologies so quickly advance Physics has traditionally been taught by treating technical topics as separate disciplines with chapters typically organized as two sequential four credit courses covering mechanics heat sound wave motion electricity magnetism and optics usually in this order But this traditional format has significant drawbacks Important similarities between the various mechanical fluid electrical and thermal systems are not directly addressed lacking in any broad understanding of how all these disciplines are interrelated and analogous Also time spent on formula derivations and proofs is done at the expense of establishing a sense of how the various systems can interact and how they are used in the scientific commercial and industrial applications To remedy these drawbacks this textbook lab manual workbook utilizes the systems approach where unifying principles across energy systems is emphasized Unifying principles are reinforced in twenty six technology based hands on laboratory activities A student workbook of twenty seven sets of student exercises with answers accompanies most sections and chapters Subject matter is organized as follows prerequisite review displacement rate mover quantities force torque pressure voltage and temperature difference work and energy and finally power By examining the language writing conventions standards of measurement and principles that are the underlying foundation of all technologies this course is designed to help students gain what they need in order to read write compute and speak tech and thereby keep up with ever changing technologies Ultimately it is hoped students will acquire the tools technicians need in order to have a successful long term career in a variety of technology related professions
