Probability and Stochastic Processes held at CMS College Kerala India on 7-10 January 2019. It showcases high quality research conducted in the field of applied probability and stochastic processes by focusing on techniques for the modelling and analysis of systems evolving with time. Further, it discusses the applications of stochastic modelling in queueing theory, reliability, inventory, financial mathematics, operations research, and more. This book is intended for a broad audience ranging from researchers interested in applied probability, stochastic modelling with reference to queueing theory, inventory, and reliability to those working in industries such as communication and computer networks, distributed information systems, next generation communication systems, intelligent transportation networks, and financial markets.

Information Technologies and Mathematical Modelling - Queueing Theory and Applications Alexander Dudin, Anatoly Nazarov, Rafael Yakupov, 2015-12-08. This book constitutes the refereed proceedings for the 14th International Scientific Conference on Information Technologies and Mathematical Modeling named after A. F. Terpugov (ITMM 2015) held in Anzhero-Sudzhensk, Russia, in November 2015. The 35 full papers included in this volume were carefully reviewed and selected from 89 submissions. They are devoted to new results in the queueing theory and its applications, addressing specialists in probability theory, random processes, mathematical modeling, as well as engineers dealing with logical and technical design and operational management of telecommunication and computer networks.

Retrial Queues and Related Models Antonio Gómez-Corral, Tuan Phung-Duc, 2016. *Advances in Queueing Theory*, 2002. **Unreliable Retrial Queues in a Random Environment** James D. Cordeiro, 2007. This dissertation investigates stability conditions and approximate steady state performance measures for unreliable single server retrial queues operating in a randomly evolving environment. In such systems, arriving customers that find the server busy or failed join a retrial queue from which they attempt to regain access to the server at random intervals. Such models are useful for the performance evaluation of communications and computer networks which are characterized by time-varying arrival, service, and failure rates. To model this time-varying behavior, we study systems whose parameters are modulated by a finite Markov process. Two distinct cases are analyzed. The first considers systems with Markov-modulated arrival, service, retrial, failure, and repair rates, assuming all interevent and service times are exponentially distributed. The joint process of the orbit size, environment state, and server status is shown to be a three-layered level-dependent quasi-birth and death (LDQBD) process, and we provide a necessary and sufficient condition for the positive recurrence of LDQBDs using classical techniques. Moreover, we apply efficient numerical algorithms designed to exploit the matrix-geometric structure of the model to compute the approximate steady state orbit size distribution and mean congestion and delay measures. The second case assumes that customers bring generally distributed service requirements while all other processes are identical to the first case. We show that the joint process of orbit size, environment state, and server status is a level-dependent M/G/1 type stochastic process. By employing regenerative theory and exploiting the M/G/1 type structure, we derive a necessary and sufficient condition for stability of the system. Finally, for the exponential model, we

illustrate how the main results may be used to simultaneously select mean time customers spend in orbit subject to bound and stability constraints

Switching Processes in Queueing Models Vladimir Anisimov, 2008-11-03 Switching stochastic models Switching queueing models Processes of sums of weakly dependent variables Averaging principle and diffusion approximation for switching processes Averaging and diffusion approximation in overloaded switching queueing systems and networks Systems in low traffic conditions Flows of rare events in low and heavy traffic conditions Asymptotic aggregation of state space Aggregation in Markov models with fast Markov switching Aggregation in Markov models with fast semi Markov switching Other applications of switching processes Simulation examples

Queueing and Related Models U. Narayan Bhat, Ishwar V. Basawa, 1992 The recent explosion of technological advances in computer and communications systems has caused a resurgence of interest in queueing theory and its applications The progress of research has uncovered several new developments and among those studied in depth here are algorithmic and numerical approaches design and control inference simulation techniques and queueing networks The book provides a broad analysis of current research activity and includes chapters by internationally established authors Professor N U Prabhu also contributes his thoughts and perspectives on recent trends and future developments in queueing theory This volume will be of value and interest to operations researchers statisticians and all those concerned with queueing theory as an important field within the discipline of applied probability
