
Mathematical Models of Epidemics

Christopher Lin, Math 89S Spring 2016

Epidemics occur often, and result in both severe human and monetary losses. However mathematical modeling of the spread of infectious diseases can reveal important insights into their behavior, and help scientists and policy makers prevent or reduce their adverse impacts.

What is an Epidemic?

Generally, an epidemic is the spread of a disease to a large number of people over a short period of time. Epidemics are divided into two major types: common source, and propagated outbreaks. Common source outbreaks occur when individuals are exposed to the same toxin or infectious agent. The epidemic of leukemia in Hiroshima following the atomic bomb detonation, or an outbreak of *E. coli* from a batch of infected vegetables would be examples of epidemics caused by a common source. More relevant to our discussion in this paper, are propagated outbreaks. In a propagated outbreak, disease is spread from person to person, such as in the case of influenza or syphilis. A propagated outbreak can also be spread by other vectors, such as mosquitoes in the case of malaria. When an epidemic spreads to encompass multiple countries or continents, it is often reclassified as a pandemic (Principles of Epidemiology in Public Health Practice).

Epidemics can cause massive human and economic losses. The Spanish Flu epidemic in 1918 caused between 40 and 50 million deaths, Asian influenza

in 1957 killed 2 million, and Hong Kong influenza in 1968 resulted in 1 million deaths (What are Epidemics). Every year, in the United States alone, more than 200,000 people are hospitalized due to influenza, and anywhere from 5% to 20% of the population becomes infected. It is estimated that between 3,000 to 49,000 people die from influenza each year (Seasonal Influenza). Economic damage can also be severe; one study estimated that the 2002 SARS outbreak in East Asia resulted in a 2.63% drop in GDP in Hong Kong, and a 1.5% drop in GDP in mainland China (Lee and McKibbin, 2004).

Because epidemics hold possibly dire consequences for entire countries, regions, or continents, it is extremely important for scientists and policy makers to prevent epidemics if possible. However, due to the complex and large-scale nature of epidemics, it is basically impossible to perform non-retrospective studies. Furthermore, any sort of controlled experiment in which a population is infected with a disease would be incredibly unethical. Thus, the best way to study, predict, and experiment with the behavior of epidemics is through mathematical modeling.

Mathematical Modeling

One of the first to develop a mathematical model of disease was the Swiss scientist and mathematician, Daniel Bernoulli, who was best known for his work with the mathematics of fluid mechanics. In 1766, Bernoulli, using a simple compartmental model and census data, was able to show that vaccinating
