

Microscale Laboratory Techniques

Traditionally, experiments in organic chemistry are carried out on a **macroscale** level, employing quantities of chemicals on the order of 5-100 g, using glassware designed to contain between 25 and 500 mL of liquids. For quantities of materials in the 0.005-0.5 gram range, one employs different, "**microscale**" techniques and equipment in order to carry out the various standard organic laboratory operations. In the following, the student is introduced to the special equipment used in microscale experiments, as well as the somewhat different methods which are used.

Basic Equipment

The glassware used for microscale experiments is in your locker. You will make sure it is all there during check-in and it must still be there during check-out. The student will be charged for missing items. Some of the contents of the microscale kit are illustrated in the drawing below.

The conical vial is used as a reaction vessel, for extractions, and as a storage container. Its flat base allows it to stand upright on the laboratory bench. The interior of the vial tapers to a narrow bottom, making it possible to withdraw liquids completely from the vial using a disposable Pasteur pipet. The vial has a screw cap which tightens by means of threads cast into the top of the vial. These threads also allow attachment of various other pieces such as a condenser or distillation head, using the double-caps provided in the kit.

Handling of Liquids

Since one rarely works with volumes larger than 2-3 mL, graduated cylinders are rarely used in microscale experiments. Instead, one uses smaller scale volumetric devices such as syringes, automatic pipets, and calibrated disposable Pasteur pipets.

Syringes are especially useful when anhydrous conditions must be maintained during an experiment. The needle can be inserted through a rubber septum sealing the reaction vessel, and the liquid added to the reaction mixture. We use plastic (polyethylene) syringes which, although they are called "disposable", can be cleaned and re-used. To fill the syringe, insert the needle into the liquid and draw in the required volume. Withdraw the syringe and pull the barrel back ever so slightly to draw any liquid remaining in the needle into the syringe.
