When it comes to fundamental programming languages you should learn for web development the answer is relatively clear you can't go wrong starting with the trio of HTML CSS and JavaScript It can get a bit more murky though with some of the other languages you'll hear mentioned in tech circles specifically whether they're helpful to learn as a web developer and what exactly they're used for One programming language you're sure to see referenced as you get familiar with tech is PHP So what is it and is it a useful programming language to learn for web development

PHP Is a Scripting Language PHP an acronym for PHP Hypertext Preprocessor is a scripting language that's generally used in server side web development Don't worry I'll explain exactly what this means below In order to sort it all out it's crucial to first understand what a scripting language is Scripting languages a family of programming languages including PHP as well as languages like JavaScript and Ruby are a subset of coding languages used to automate processes that otherwise would need to be executed step by step in a site's code every time they occur This includes things like dialogue boxes opening on a screen in response to a user's actions chatbots responding to defined user behavior with corresponding messages or animation that happens when a user scrolls past a certain point on a page any dynamic website functions that need to occur on screen without the user having to manually reload a site Scripting languages like PHP are distinct from markup languages like HTML and CSS in the sense that while HTML and CSS

determine the layout and look of web pages scripting languages tell a static web page built with HTML and CSS to do specific actions If you've spent any time reading about JavaScript this might sound familiar So is PHP just another way of accomplishing the things you can do with JavaScript Not exactly PHP Is Used For Server Side Scripting As mentioned previously PHP is typically used as a server side language as opposed to a language like JavaScript that's generally executed on the client side So what does that mean In programming terms client side refers to website activity that takes place locally on a user's computer through the user's web browser Client side languages like HTML CSS and JavaScript give instructions that web browsers can parse and translate into content on your computer screen Notice JavaScript a scripting language like PHP is on that list Again the processes scripted by JavaScript take place on the client side JS provides instructions that can be understood by and executed in your web browser Client side is the side you see when you're using the internet On the other hand server side activity involves a web browser sending requests to a web server the software or hardware that stores a website's pages images media and other assets which then responds to the request with HTML code that can be processed and rendered by the web browser and turned into content on the user's screen
