

PHYSICAL HEALTH

Regular exercise benefits your physical health and mental well-being and helps you live an active, fulfilling life. Believe it or not, research shows a link between regular exercise and academic performance! All young people should aim to have at least 60 minutes of exercise daily. Why not choose something you enjoy to stay fit?

What does physical health involve?

Healthy Weight

Being overweight or obese is associated with many health conditions. Losing excess weight is one of the best things you can do for your physical health. It's not always easy, but losing weight will improve your overall wellbeing, decrease your risk of illness, and give you more energy.

Healthy Eating

In general, the greener or more colourful the plate is the healthier it is. A well-balanced diet is rich in nutrients, with fruit, vegetables, lean meats, and whole grains. Healthy eating and hydration are required to support the body's functions and for energy. Good food is the body's fuel - keep it clean and natural.

Relaxation

A good sleep routine is essential for the body to rest, de-stress and get the energy to keep working. Your mind and body need an average of 8 hours of sleep every night. The body needs to be able to unwind through relaxation to prevent burnout. Muscles may tense up causing back and headaches if you don't relax regularly.

Wellbeing

If we sustain good physical health, we manage to, well, stay healthy - it affects our overall wellbeing. Wellbeing incorporates good mental and physical health. Getting enough sleep, relaxation, exercise, a good diet and maintaining hygiene standards are all factors in our overall wellbeing.

Exercise

Exercise is important for overall general health. It helps with weight control, mental health, reduces your risk of many health conditions and builds strength, flexibility, and endurance. Exercise stimulates our metabolism and improves our energy levels.

How Do Emotions and Feelings Regulate Physical Activity? Darko Jekauc, Ralf Brand, 2017-09-12 Up to date the scientific discussion about how frequency and regularity of physical activity can be increased is dominated by social cognitive models However increasing evidence suggests that emotions and feelings have greater influence on physical activity than originally assumed Rhodes Fiala Conner 2009 Generally speaking humans possess an evaluative system with a basic action tendency to approach pleasurable events and to avoid aversive ones Cacioppo Berntson 1999 Evaluative responses to a behavior and associated emotional states may influence a decision regarding whether or not to repeat being physically active Generally behavior associated with positive evaluations has a higher probability of being repeated than behaviors without such an association On the contrary an association with negative evaluations tends to decrease the probability of repeating to be physically active Hence evaluative responses to physical activity or the related situation can be an important aspect in the process of physical activity maintenance McAuley et al 2007 Several social cognitive models of behavior change and maintenance were recently extended to take the influence of affective responses into account in a way that variables already included in the models e g outcome expectancies or attitudes were more clearly articulated into their cognitive and affective components For example with regard to Social Cognitive Theory Gellert Ziegelmann and Schwarzer 2012 proposed to distinguish between affective and health related outcome expectancies and in the Theory of Planned Behavior researchers suggested to differentiate between cognitive and affective attitudes Lawton Conner McEachan 2009 The results of these and other studies suggest that affective components make a unique contribution to the explanation of the physical activity behavior Brand 2006 Other examples come from social cognition research where it was shown that automatic evaluative responses are part of our everyday life and that they decisively influence health behavior Hofmann Friese Wiers 2008 Accordingly there is evidence that people who exercise regularly hold more positive automatic evaluations with exercise than non exercisers Bluemke Brand Schweizer Kahlert 2010 Although significant progress has been made in showing that evaluative responses to physical activity and associated emotional states are important predictors of physical activity underlying psychological processes are far from being fully understood Some important issues still remain to be resolved Which role play affective states compared to concrete emotions when influencing physical activity How do affective states and emotions interact with cognitive variables such as intentions Are evaluative processes before during or after physical activity important to predict future physical activity Do negative and positive evaluations interact antagonistically or rather synergistically when physical activity as a new behavior shall be adopted Future research will help us to resolve these and a lot of other so far unresolved issues
