Situational Method Engineering Brian Henderson-Sellers, Jolita Ralyté, Pär J. Ågerfalk, Matti Rossi, 2014-06-03 While previously available methodologies for software like those published in the early days of object technology claimed to be appropriate for every conceivable project situational method engineering SME acknowledges that most projects typically have individual characteristics and situations Thus finding the most effective methodology for a particular project needs specific tailoring to that situation Such a tailored software development methodology needs to take into account all the bits and pieces needed for an organization to develop software including the software process the input and output work products the people involved the languages used to describe requirements design code and eventually also measures of success or failure The authors have structured the book into three parts Part I deals with all the basic concepts terminology and overall ideas underpinning situational method engineering As a summary of this part they present a formal meta model that enables readers to create their own quality methods and supporting tools In Part II they explain how to implement SME in practice i e how to find method components and put them together and how to evaluate the resulting method For illustration they also include several industry case studies of customized or constructed processes highlighting the impact that high quality engineered methods can have on the success of an industrial software development Finally Part III summarizes some of the more recent and forward looking ideas This book presents the first summary of the state of the art for SME For academics it provides a comprehensive conceptual framework and discusses new research areas For lecturers thanks to its step by step explanations from basics to the customization and quality assessment of constructed methods it serves as a solid basis for comprehensive courses on the topic For industry methodologists it offers a reference guide on features and technologies to consider when developing in house software development methods or customising and adopting off the shelf ones

About The Book: Requirements Engineering is a new term for an old problem in the past known as Systems Analysis and also Knowledge Elicitation. Requirements constitute the earliest phase of the software development cycle. Requirements are precise statements that reflect the needs of customers and users of an intended computer system. e.g. a word processor must include a spell checker, security access is to be given to authorized personnel only, updates to customer information must be made every 10 seconds.

Requirements engineering is being recognized as increasingly important, no other aspect of software engineering has enjoyed as much growth in recent years. More and more organizations are either improving their requirements engineering process or thinking about doing so.

Requirements in Engineering Projects João M. Fernandes, Ricardo J. Machado, 2015-07-18 This book focuses on various topics related to engineering and management of requirements, in particular elicitation, negotiation, prioritisation, and documentation, whether with natural languages or with graphical models. The book provides methods and techniques that help to characterise in a systematic manner the requirements of the intended engineering system. It was written with the goal of being adopted as the main text for courses on requirements engineering or as a strong reference to the topics of requirements in courses with a broader scope. It can also be used in vocational courses for professionals interested in the software and information systems domain. Readers who have finished this book will be able to establish and plan a requirements engineering process within the development of complex engineering systems, define and identify the types of relevant requirements in engineering projects, choose and apply the most appropriate techniques to elicit the requirements of a given system, conduct and manage negotiation and prioritisation processes for the requirements of a given engineering system, document the requirements of the system under development, either in natural language or with graphical and formal models. Each chapter includes a set of exercises.
