New Aspects In Interpolation And Completion Theories:

New Aspects in Interpolation and Completion Theories I. Gohberg, 2012-12-06 This volume consists of eight papers containing recent advances in interpolation theory for matrix functions and completion theory for matrices and operators In the first paper D Alpay and P Loubaton The tangential trigonometric moment problem on an interval and related topics a trigonometric moment problem on an interval for matrix valued functions is studied The realization approach plays an important role in solving this problem The second paper M Bakonyi V G Kaftal G Weiss and H J Woerdeman Max imum entropy and joint norm bounds for operator extensions is dedicated to a matrix completion problem In it is considered the problem when only the lower triangular part of the operator entries of a matrix is identified Completions which have simultaneously a small usual norm and a small Hilbert Schmidt norm are considered Bounds for these norms are obtained The analysis of the maximum entropy extension plays a special role The paper contains applications to nest algebras and integral operators The third paper J A Ball I Gohberg and M A Kaashoek Bitangential interpola tion for input output operators of time varying systems the discrete time case contains solutions of time varying interpolation problems The main attention is focused on the time varying analog of the Nevanlinna Pick tangential problem in the case where the inter polation conditions appear from two sides The state space theory of time varying systems play an important role Lectures on Operator Theory and Its Applications Albrecht Böttcher, 1996 Much of the importance of mathematics lies in its ability to provide theories which are useful in widely different fields of endeavour A good example is the large and amorphous body of knowledge known as the theory of linear operators or operator theory which came to life about a century ago as a theory to encompass properties common to matrix differential and integral operators Thus it is a primary purpose of operator theory to provide a coherent body of knowledge which can explain phenomena common to the enormous variety of problems in which such linear operators play a part The theory is a vital part of functional analysis whose methods and techniques are one of the major advances of twentieth century mathematics and now play a pervasive role in the modeling of phenomena in probability imaging signal processing systems theory etc as well as in the more traditional areas of theoretical physics and mechanics This book is based on lectures presented at a meeting on operator theory and its applications held at the Fields Institute in 1994 **Operator Algebras, Operator Theory and Applications** J. J. Grobler, L.E. Labuschagne, Manfred Möller, 2009-12-24 This volume contains the proceedings of the eighteenth International Workshop on Operator Theory and Applications IWOTA hosted by the Unit for Business Mathematics and Informatics of North West University Potchefstroom South Africa from July 3 to 6 2007 The conference as well as these proceedings was dedicated to Professors Joseph A Ball and Marinus M Kaashoek on the occasion of their 60th and 70th birthdays respectively This conference had a particular focus on Von Neumann algebras at the interface of operator theory with functional analysis and on applications of operator theory to differential equations **Operator Theory, Analysis and the State Space Approach** Harm Bart, Sanne ter

Horst, André C.M. Ran, Hugo J. Woerdeman, 2018-12-30 This volume is dedicated to Rien Kaashoek on the occasion of his 80th birthday and celebrates his many contributions to the field of operator theory during more than fifty years In the first part of the volume biographical information and personal accounts on the life of Rien Kaashoek are presented Eighteen research papers by friends and colleagues of Rien Kaashoek are included in the second part Contributions by J Agler Z A Lykova N J Young J A Ball G J Groenewald S ter Horst H Bart T Ehrhardt B Silbermann J M Bogoya S M Grudsky I S Malysheva A Böttcher E Wegert Z Zhou Y Eidelman I Haimovici A E Frazho A C M Ran B Fritzsche B Kirstein C Madler J J Jaftha D B Janse van Rensburg P Junghanns R Kaiser J Nemcova M Petreczky J H van Schuppen L Plevnik P Semrl A Sakhnovich F O Speck S Sremac H J Woerdeman H Wolkowicz and N Vasilevski Convolution Operators and Factorization of Almost Periodic Matrix Functions Albrecht Böttcher, Yuri I. Karlovich, Ilya M. Spitkovsky, 2012-12-06 Many problems of the engineering sciences physics and mathematics lead to convolution equations and their various modifications Convolution equations on a half line can be studied by having recourse to the methods and results of the theory of Toeplitz and Wiener Hopf operators Convolutions by integrable kernels have continuous symbols and the Cauchy singular integral operator is the most prominent example of a convolution operator with a piecewise continuous symbol The Fredholm theory of Toeplitz and Wiener Hopf operators with continuous and piecewise continuous matrix symbols is well presented in a series of classical and recent monographs Symbols beyond piecewise continuous symbols have discontinuities of oscillating type Such symbols emerge very naturally For example difference operators are nothing but convolution operators with almost periodic symbols the operator defined by A Topics in Interpolation Theory Harry Dym, 1997 Operator Methods in Ordinary and Partial Differential Equations Sergio Albeverio, Nils Elander, W. Systems and Convolution Operators Robert Ellis, Israel Gohberg, 2003 The main concern of this book is the distribution of zeros of polynomials that are orthogonal on the unit circle with respect to an indefinite weighted scalar or inner product The first theorem of this type proved by M G Krein was a far reaching generalization of G Szeg's result for the positive definite case A continuous analogue of that theorem was proved by Krein and H Langer These results as well as many generalizations and extensions are thoroughly treated in this book A unifying theme is the general problem of orthogonalization with invertible squares in modules over C algebras Particular modules that are considered in detail include modules of matrices matrix polynomials matrix valued functions linear operators and others One of the central features of this book is the interplay between orthogonal polynomials and their generalizations on the one hand and operator theory especially the theory of Toeplitz matrices and operators and Fredholm and Wiener Hopf operators on the other hand The book is of interest to both engineers and specialists in analysis
