## Pack Ice:

*Sea Ice* David N. Thomas, Gerhard S. Dieckmann, 2008-04-15 Sea ice which covers up to 7% of the planet's surface is a major component of the world's oceans partly driving ocean circulation and global climate patterns. It provides a habitat for a rich diversity of marine organisms and is an extremely valuable source of information in studies of global climate change and the evolution of present day life forms. Increasingly sea ice is being used as a proxy for extraterrestrial ice covered systems. *Sea Ice* provides a comprehensive review of our current available knowledge of polar pack ice, the study of which is severely constrained by the logistic difficulties of working in such harsh and remote regions of the earth. The book's editors, Drs Thomas and Dieckmann, have drawn together an impressive group of international contributing authors providing a well edited and integrated volume which will stand for many years as the standard work on the subject. Contents of the book include details of the growth, microstructure and properties of sea ice, large scale variations in thickness and characteristics, its primary production, micro and macrobiology, sea ice as a habitat for birds and mammals, sea ice biogeochemistry, particulate flux and the distribution and significance of palaeo sea ice. *Sea Ice* is an essential purchase for oceanographers and marine scientists, environmental scientists, biologists, geochemists and geologists. All those involved in the study of global climate change will find this book to contain a wealth of important information. All libraries in universities and research establishments where these subjects are studied and taught will need multiple copies on their shelves. David Thomas is at the School of Ocean Sciences, University of Wales Bangor, UK. Gerhard Dieckmann is at the Alfred Wegener Institute for Polar and Marine Research, Bremerhaven, Germany.
