Killer Robots Armin Krishnan, 2016-04-22 Military robots and other potentially autonomous robotic systems such as unmanned combat air vehicles UCAVs and unmanned ground vehicles UGVs could soon be introduced to the battlefield Look further into the future and we may see autonomous micro and nanorobots armed and deployed in swarms of thousands or even millions This growing automation of warfare may come to represent a major discontinuity in the history of warfare humans will first be removed from the battlefield and may one day even be largely excluded from the decision cycle in future high tech and high speed robotic warfare Although the current technological issues will no doubt be overcome the greatest obstacles to automated weapons on the battlefield are likely to be legal and

ethical concerns Armin Krishnan explores the technological legal and ethical issues connected to combat robotics examining both the opportunities and limitations of autonomous weapons He also proposes solutions to the future regulation of military robotics through international law

Humanoid robot control policy and interaction design. A study on simulation to machine deployment Suman Deb,2019-08-06 Technical Report from the year 2019 in the subject Engineering Robotics grade 9 language English abstract Robotic agents can be made to learn various tasks through simulating many years of robotic interaction with the environment which cannot be made in case of real robots With the abundance of a large amount of replay data and the increasing fidelity of simulators to implement complex physical interaction between the robots and the environment we can make them learn various tasks that would require a lifetime to master But the real benefits of such training are only feasible if it is transferable to the real machines Although simulations are an effective environment for training agents as they provide a safe manner to test and train agents often in robotics the policies trained in simulation do not transfer well to the real world This difficulty is compounded by the fact that oftentimes the optimization algorithms based on deep learning exploit simulator flaws to cheat the simulator in order to reap better reward values Therefore we would like to apply some commonly used reinforcement learning algorithms to train a simulated agent modelled on the Aldebaran NAO humanoid robot The problem of transferring the simulated experience to real life is called the reality gap In order to bridge the reality gap between the simulated and real agents we employ a Difference model which will learn the difference between the state distributions of the real and simulated agents The robot is trained on two basic tasks of navigation and bipedal

walking Deep Reinforcement Learning algorithms such as Deep Q Networks DQN and Deep Deterministic Policy Gradients DDPG are used to achieve proficiency in these tasks We then evaluate the performance of the learned policies and transfer them to a real robot using a Difference model based on an addition to the DDPG algorithm
