Macroeconomic Policy Modelling for Developing Countries Victor Murinde,1993 How can developing countries design a macroeconomic policy framework that will reverse the current trend of persistent inflation regressive real growth and foreign exchange bottlenecks One plausible answer emerges from an intersection between the dilemma and a novel analytical approach In this book Victor Murinde develops one

novel approach by drawing on the first principles of economic theory to construct a macroeconomic model such that the structural features and bottlenecks of a developing country are integrally incorporated. The model is small and congruent with the limited available data but it is comprehensive enough to address the key policy instruments and targets. A battery of modern econometric techniques are called upon to estimate and test the model on Kenya, Tanzania and Uganda since independence in a country specific as well as cross country spirit. Policy experiments are performed to highlight the macroeconomic scenario generated each time a policy instrument or a stabilization policy package is implemented. The experiments fully demonstrate the practicability of the small model limited data methodology developed in the book

Modeling Developing Countries' Policies In General Equilibrium Jaime De Melo, 2015-02-26. Policies affecting resource allocation across tradable sectors and those affecting the incentives to produce tradable activities are key determinants of macroeconomic balance and growth. Computable general equilibrium models have made significant contributions to both types of policies. With advancements in computing power and software these models have become easy to implement and are now widespread. The question then is when and how to formulate them to avoid the black box syndrome. This book seeks to address these issues through carefully selected essays that analyse how to model general equilibrium linkages in a single economy across developing and developed economies and across both micro and macro policies. Micro policies examined include tariffs, quotas and VERs, the choice of taxes to maximize government revenue, migration and remittances and the political economy of tariff setting. Applications on macro policies cover capital inflows, real exchange rate determination and the modeling of the effects of adjustment policies on income distribution. The book provides insights on the development of a family of models for diverse policy choices focusing on the ways to model the following links between tradable and non tradable activities, labor markets and portfolio choices given limited capital mobility. Selected essays are all inspired by specific policy problems including the adaptation to external shocks, i.e. oil, consequences of capital inflows, determinants of migration and associated remittances, the productivity of foreign aid and rent seeking activities under trade regimes with non price trade restrictions. Examples in this book lay out the theoretical foundations alongside a variety of applications to help formulate coherent and transparent models for policy analysis. Archetype economies are extensively used to show how differences in economic structure influence the effects of policies. Graduate students and policy analysts interested in modeling will find this a useful compendium of studies.
