

# Nuclear wastes

Nuclear plants produce large amounts of electric power without the carbon dioxide emissions that cause the greenhouse effect and lead to global warming. However, the reactions that generate nuclear energy result in radioactive waste that is highly dangerous for people, all living beings and the environment as a whole. The storage of this waste is a huge problem that nuclear plants are still to resolve.

**500**  
TIMES MORE RADIOACTIVE

more than thousands of years have elapsed during the accident in Chernobyl, Ukraine in 1986.

**COOLING TOWER**  
The water that has been heated in the reactor is cooled in these towers. The water vapor that is emitted is used to generate the electricity of the plant.

**RECYCLING**  
A part of the waste can be reprocessed to be reused as fuel.

## BURIED WASTE

A suitable and secure way for the long-term storage of nuclear waste, is to bury it in a geologically stable site near the plant. Waste must be treated there, completely sealed without any contact with water, land or air.

**1**  
**DRILLING**  
The first step is to prepare the storage site to drill deep in a remote area that is geologically stable.

**2**  
**LEVELING**  
The next step is to level the bottom of the well so that the barrels of radioactive material can be stored appropriately.

**3**  
Radioactive waste containers should be stored tightly to prevent any movement that may cause spillage.

**4**  
Once the wells are filled, they are sealed using special concrete that ensures stability.

**FUEL**  
The fuel element elements used in the nuclear plants are approximately 200 cm long and 2.5 cm in diameter. After 3 years, they are removed from the reactor and reprocessed. The waste that remains after reprocessing is sent to the storage site for thousands of years.
