PURPOSE OF THE EXPERIMENT

BACKGROUND REQUIRED

You should be familiar with basic techniques for measuring volume and mass. You should understand the concepts associated with solution chemistry and stoichiometry.

BACKGROUND INFORMATION

A binary mixture is a mixture containing only two components. We can use a variety of methods, either physical or chemical, to separate the components of such a mixture. Physical separation methods are based on differences between the physical properties of the components, such as solubility or boiling point.

One physical method for separating a liquid from a solid is decantation. First, we allow the solid to settle to the bottom of the container. Then we carefully pour off all of the liquid, called the supernatant liquid, or supernate, into another container, without disturbing the solid.

We can also physically separate a solid from a liquid by filtration, a method that involves pouring the mixture onto a porous material, such as filter paper. The solid, called the residue, is unable to pass through the pores in the filter paper, so it is retained on the paper. The liquid, which passes through the paper, is called the filtrate.

Evaporation is a third physical separation method, in which a solution is heated to vaporize and thus remove the solvent. The solid remaining after we have evaporated the solvent was the solute.

When one component of a binary mixture of two solids is soluble in a particular solvent, and the other component is not, we can separate the components using a fourth physical method, extraction. We add the
