## **Probabilistic Data Analysis For Operations Research:**

*Probabilistic Data-Driven Modeling* Tomaso Aste, 2025-05-01 A probabilistic data driven modeling toolbox to help students and researchers characterize classify and model real complex systems

*Visualization and Verbalization of Data* Jorg Blasius, Michael Greenacre, 2014-04-10 Visualization and Verbalization of Data shows how correspondence analysis and related techniques enable the display of data in graphical form which results in the verbalization of the structures in data. Renowned researchers in the field trace the history of these techniques and cover their current applications. The first part of the book explains the historical origins of correspondence analysis and associated methods. The second part concentrates on the contributions made by the school of Jean Paul Benz cri and related movements such as social space and geometric data analysis. Although these topics are viewed from a French perspective the book makes them understandable to an international audience. Throughout the text well known experts illustrate the use of the methods in practice. Examples include the spatial visualization of multivariate data cluster analysis in computer science the transformation of a textual data set into numerical data the use of quantitative and qualitative variables in multiple factor analysis different possibilities of recoding data prior to visualization and the application of duality diagram theory to the analysis of a contingency table.

**Probabilistic Models in Operations Research** Silviu Guiasu, 2009 Operations Research often abbreviated as OR is a relatively new branch of Applied Mathematics. Its aim is to optimise mathematical models of reality involving probabilistic uncertainty and its results are applied to real life problems. The aim of this book is to cover in a condensed but rigorous way the main chapter of the OR probabilistic models based on optimisation. The topics are taken from Game Theory Decision Theory Simulation Reliability and Queueing Theory. Game Theory deals with how to find the best winning strategies in a confrontation between two players with opposite interest and how to evaluate the value of different possible coalitions in a game involving more than two players. In Decision Theory the main objective is to find the optimum actions of the decision maker for minimising his loss when he has limited information available and faces uncertainty about the future possible events. Simulation is a powerful instrument for obtaining representative examples of any length from probability distributions of interest and for approximating multiple definite integrals and the solutions of linear and non linear equations and programs. In the chapter dealing with Reliability the main problem is how to evaluate the probability that a system functions properly or is still alive during an arbitrary time interval. Finally Queueing Theory deals with how to assess what may happen in a complex system where the customers arrive randomly wait in line and later are served. A main concept is the waiting time in the queueing system waiting to be served and being served. In each chapter some representative examples and the mathematical formalism are discussed first eventually followed by the comments on ramifications generalisations and applications of the basic results. Computer tips and programs are inserted in each chapter. The text is based on lectures delivered for more than twenty five years in the Department of Mathematics and Statistics at York University in Toronto. The

book is rather a monograph on the probabilistic modes in Operations Research which could also be used as a text book in a more advanced OR course The book is self contained compact and accessible to mathematicians economists system analysts decision makers and people dealing with computer assisted modelling It contains also new original topics and proofs not covered in the standard OR textbooks The chapters are kept to be as independent as possible
