

Principle Of Semiconductor Laser

When the P-N Junction diode is **Forward Biased** (i.e) the *P* end of the diode is connected to the positive terminal of the battery and the *N* end is connected to the negative terminal of the battery. The holes and electrons diffuse through the junction and combine with each other; meanwhile light radiations or photons are radiated. This is called **Recombination Radiation**

These emitted photons stimulate other electrons & holes to recombine which is called **Lasing Action**
