is the fourth in a series on novel low power design architectures methods and design practices It results from of a large European project started in 1997 whose goal is to promote the further development and the faster and wider industrial use of advanced design methods for reducing the power consumption of electronic systems Low power design became crucial with

the wide spread of portable information and communication terminals where a small battery has to last for a long period High performance electronics in addition suffers from a permanent increase of the dissipated power per square millimeter of silicon due to the increasing clock rates which causes cooling and reliability problems or otherwise limits the performance The European Union's Information Technologies Programme Esprit did therefore launch a Pilot action for Low Power Design which eventually grew to 19 R D projects and one coordination project with an overall budget of 14 million EURO It is meanwhile known as European Low Power Initiative for Electronic System Design ESD LPD and will be completed in the year 2002 It involves to develop or demonstrate new design methods for power reduction while the coordination project takes care that the methods experiences and results are properly documented and publicised

advanced VLSI circuits It explains that as a consequence of the increasing dominance of optical interconnects for high performance workstation clusters and supercomputers their complete design has to be revised This book thus covers for the first time the whole variety of interdependent subjects contributing to green photonics and electronics serving communication and energy harvesting Alternative approaches to generate electric power using organic photovoltaic solar cells inexpensive and again energy efficient in production are summarized In 2015 the use of the internet consumed 5.6% of the raw electricity production in developed countries Power consumption increases rapidly and without some transformational change will use by the middle of the next decade at the latest the entire electricity production This apocalyptic outlook led to a redirection of the focus of data center and HPC developers from just increasing bit rates and capacities to energy efficiency The high speed interconnects are all based on photonic devices These must and can be energy efficient but they operate in an electronic environment and therefore have to be considered in a wide scope that also requires low energy electronic devices sophisticated circuit designs and clever architectures The development of the next generation of high performance exaFLOP computers suffers from the same problem Their energy consumption based on present device generations is essentially prohibitive

1 Power dissipation trends in CMOS circuits Shrinking device geometry growing chip area and increased data processing speed performance are technological trends in the integrated circuit industry to enlarge chip functionality Already in 1965 Gordon Moore predicted that the total number of devices on a chip would double every year until the 1970s and every 24 months in the 1980s This prediction is widely known as Moore's Law and eventually culminated in the Semiconductor Industry Association SIA technology road map 1 The SIA road map has been a guide for the industry leading them to continued wafer and die size growth increased transistor density and operating frequencies and defect density reduction To mention a few numbers the die size increased 7% per year the smallest feature sizes decreased 30% and the operating frequencies doubled every two years As a consequence of these trends both the number of transistors and the power dissipation per unit area increase In the near future the maximum power dissipation per unit area will be reached Down scaling of the supply voltage is not only the most effective way to reduce power dissipation in general it also is a necessary precondition to ensure device reliability by reducing electrical fields and device temperature to prevent device degradation A drawback of this solution is an increased signal propagation delay which results in a lower data processing speed performance Logic Synthesis for Low Power VLSI Designs Sasan Iman, Massoud Pedram, 2012-12-06 Logic Synthesis for Low Power VLSI Designs presents a systematic and comprehensive treatment of power modeling and optimization at the logic level More precisely this book provides a detailed presentation of methodologies algorithms and CAD tools for power modeling estimation and analysis synthesis and optimization at the logic level Logic Synthesis for Low Power VLSI Designs contains detailed descriptions of technology dependent logic transformations and optimizations technology decomposition and mapping and post mapping structural optimization techniques for low power It also emphasizes the trade off techniques for two level and multi level logic circuits that involve power dissipation and circuit speed in the hope that the readers can better understand the issues and ways of achieving their power dissipation goal while meeting the timing constraints Logic Synthesis for Low Power VLSI Designs is written for VLSI design engineers CAD professionals and students who have had a basic knowledge of CMOS digital design and logic synthesis *Semicustom Ic Yearbook* Stanley Hurst, 1990 **1997 27th International Symposium on Multiple-Valued Logic**, 1997 **1997 International Symposium on VLSI Technology, Systems, and Applications**, 1997 Proceedings of ASP-DAC/VLSI Design 2002, 2002 Papers from a January 2002 conference are organized into four sessions each on low power design synthesis testing layout and interconnects and technology as well as two sessions each on embedded systems verification and VLSI architecture one session on analog design and one session on hot c Electronic Circuit Analysis and Design Donald A.
