Research Directions in Distributed Parameter Systems Ralph C. Smith, Michael A. Demetriou, 2003-01-01 Eleven chapters written by experts in their respective fields on topics ranging from control of the Navier Stokes equations to nondestructive evaluation all of which are modeled by distributed parameter systems **Scientific and Technical Aerospace Reports**, 1994

Engineering Approaches to Study Cardiovascular Physiology: Modeling, Estimation, and Signal Processing Riccardo Barbieri, Zhe Chen, With cardiovascular diseases being one of the main causes of death in the world quantitative modeling assessment and monitoring of the cardiovascular control system plays a critical role in bringing important breakthroughs to cardiovascular care Quantification of cardiovascular physiology and its control dynamics from physiological recordings and by use of mathematical models and algorithms has been proved to be of important value in understanding the causes of cardiovascular diseases and assisting the prognostic or diagnostic process Nowadays development of new recording technologies e.g. electrophysiology imaging ultrasound etc has enabled us to improve and expand acquisition of a wide spectrum of physiological measures related to cardiovascular control An emerging challenge is to process and interpret such increasing amount of information by using state of the art approaches in systems modeling estimation and control and signal processing which would lead to further insightful scientific findings In particular multi disciplinary engineering empowered approaches of studying cardiovascular systems would greatly deepen our understanding of cardiovascular functions e.g. heart rate variability baroreflex sensitivity and autonomic control as it would also improve the knowledge about heart pathology cardiovascular rehabilitation and therapy Meanwhile developing cardiovascular biomedical devices or heart machine interface for either clinical monitoring or rehabilitation purpose is of greater and greater interest for both scientific advancement and potential medical benefits This Research Topic will bring together established experts whose areas of research cover a wide range of studies and applications Contributions include but are not limited to state of the art modeling methodologies algorithmic development in signal processing and estimation as well as applications in cardiovascular rehabilitation and clinical monitoring The Research Topic will consider both invited reviews and original research

Optimal Mobile Sensing and Actuation Policies in Cyber-physical Systems Christophe Tricaud, YangQuan Chen, 2011-10-14 A successful cyber physical system a complex interweaving of hardware and software with some part of the physical environment depends on proper identification of the often pre-existing physical element A bespoke cyber part of the system may then be designed from scratch Optimal Mobile Sensing and Actuation Strategies in Cyber physical Systems focuses on distributed parameter systems the dynamics of which can be modelled with partial differential equations These are very challenging to observe their states and inputs being distributed throughout a spatial domain Consequently systematic approaches to the optimization of sensor location have to be devised for parameter estimation The text begins by reviewing the field of cyber physical systems and introducing background notions of

distributed parameter systems and optimal observation theory New research problems are then defined within this framework Two important problems considered are optimal mobile sensor trajectory planning and the accuracy effects and allocation of remote sensors These are followed up with a solution to the problem of optimal robust estimation Actuation policies are then introduced into the framework with the purpose of improving estimation and optimizing the trajectories of both sensors and actuators simultaneously The large number of illustrations within the text will assist the reader to visualize the application of the methods proposed A group of similar examples are used throughout the book to help the reader assimilate the material more easily The monograph concentrates on the use of methods for which a cyber physical systems infrastructure is required The methods are computationally heavy and require mobile sensors and actuators with communications abilities Application examples cover fields from environmental science to national security so that readers are encouraged to link the ideas of cyber physical systems with their own research
