Representation Theory And Complex Geometry:

Representation Theory and Complex Geometry Neil Chriss, Victor Ginzburg, 2009-12-24 The book is largely self contained There is a nice introduction to symplectic geometry and a charming exposition of equivariant K theory Both are enlivened by examples related to groups An attractive feature is the attempt to convey some informal wisdom rather than only the precise definitions As a number of results are due to the authors one finds some of the original excitement This is the only available introduction to geometric representation theory it has already proved successful in introducing a new generation to the subject Bulletin of the AMS

Representation Theory and Complex Geometry Victor Ginzburg, 2005-05-01 see attached This second edition of it Representation Theory and Complex Geometry provides an overview of significant advances in representation theory from a geometric standpoint A geometrically oriented treatment has long been desired especially since the discovery of cal D modules in the early 80s and the quiver approach to quantum groups in the early 90s The first half of the book fills the gap between the standard knowledge of a beginner in Lie theory and the much wider background needed by the working mathematician Thus Chapters 1 3 and 5 6 provide some basics in symplectic geometry Borel Moore homology the geometry of semisimple groups equivariant algebraic K theory from scratch and the topology and algebraic geometry of flag varieties and conjugacy classes respectively The material covered by Chapters 5 and 6 as well as most of Chapter 3 has never been presented in book form Chapters 3 4 and 7 8 present a uniform approach to representation theory of three quite different objects Weyl groups Lie algebra \mathfrak{sl}_n and the Iwahori Hecke algebra The results of Chapters 4 and 8 with complete proofs are not to be found elsewhere in the literature This second edition contains substantial updates and revisions to include more standard classical results in chapters 2 3 5 and 6 as well as two new chapters Chapter 9 treats the applications of cal D modules to Lie groups and includes the study of Differential operators on a semisimple group and on its flag manifold the famous Beilinson Bernstein Localization Theorem reducing the study of \mathfrak{g} modules to that of cal D modules the so called Harish Chandra holonomic system Chapter 10 is devoted to some very exciting developments connecting the representations of quantum groups to the geometry of quiver varieties introduced by Lusztig and Nakajima The subject is closely related to many other important topics such as the McKay correspondence semismall resolutions and Hilbert schemes Overall this chapter puts the representation theory of Kac Moody algebras and quantum groups in this broader context The exposition is practically self contained with each chapter potentially serving as a basis for a graduate course or seminar An excellent glossary of notation comprehensive bibliography and extensive index round out this new edition The techniques developed here play an essential role in the development of the Langlands program and can be successfully applied to representation theory quantum groups and quantum field theory affine Lie algebras algebraic geometry and mathematical physics

Representation Theory and Complex Geometry Neil Chriss, Victor Ginzburg, 1997 This volume is an attempt to

provide an overview of some of the recent advances in representation theory from a geometric standpoint A geometrically oriented treatment is very timely and has long been desired especially since the discovery of D modules in the early 80s and the quiver approach to quantum groups in the early 90s

complex geometry and representation theory held on June 18 2012 at the Texas Christian University in Fort Worth TX Phillip Griffiths of the Institute for Advanced Study gave 10 lectures describing now classical work concerning how the structure of Shimura varieties as quotients of Mumford Tate domains by arithmetic groups had been used to understand the relationship between Galois representations and automorphic forms He then discussed recent breakthroughs of Carayol that provide the possibility of extending these results beyond the classical case His lectures will appear as an independent volume in the CBMS series published by the AMS This volume which is dedicated to Phillip Griffiths contains carefully written expository and research articles Expository papers include discussions of Noether Lefschetz theory algebraicity of Hodge loci and the representation theory of SL_2 R Research articles concern the Hodge conjecture Harish Chandra modules mirror symmetry Hodge representations of Q algebraic groups and compactifications distributions and quotients of period domains It is expected that the book will be of interest primarily to research mathematicians physicists and upper level graduate students

Tirao, 1998 The representation theory of Lie groups plays a central role in both classical and recent developments in many parts of mathematics and physics In August 1995 the Fifth Workshop on Representation Theory of Lie Groups and its Applications took place at the Universidad Nacional de Cordoba in Argentina Organized by Joseph Wolf Nolan Wallach Roberto Miatello Juan Tirao and Jorge Vargas the workshop offered expository courses on current research and individual lectures on more specialized topics The present volume reflects the dual character of the workshop Many of the articles will be accessible to graduate students and others entering the field Here is a rough outline of the mathematical content The editors beg the indulgence of the readers for any lapses in this preface in the high standards of historical and mathematical accuracy that were imposed on the authors of the articles Connections between flag varieties and representation theory for real reductive groups have been studied for almost fifty years from the work of Gelfand and Naimark on principal series representations to that of Beilinson and Bernstein on localization The article of Wolf provides a detailed introduction to the analytic side of these developments He describes the construction of standard tempered representations in terms of square integrable partially harmonic forms on certain real group orbits on a flag variety and outlines the ingredients in the Plancherel formula Finally he describes recent work on the complex geometry of real group orbits on partial flag varieties

Bulletin of the American Mathematical Society American Mathematical Society, 1908 Mumford-Tate Groups and

Domains Mark Green, Phillip Griffiths, Matthew D. Kerr, 2012 Mumford Tate groups are the fundamental symmetry groups of Hodge theory a subject which rests at the center of contemporary complex algebraic geometry This book is the first comprehensive exploration of Mumford Tate groups and domains Containing basic theory and a wealth of new views and results it will become an essential resource for graduate students and researchers Although Mumford Tate groups can be

defined for general structures their theory and use to date has mainly been in the classical case of abelian varieties While the book does examine this area it focuses on the nonclassical case The general theory turns out to be very rich such as in the unexpected connections of finite dimensional and infinite dimensional representation theory of real semisimple Lie groups The authors give the complete classification of Hodge representations a topic that should become a standard in the finite dimensional representation theory of noncompact real semisimple Lie groups They also indicate that in the future a connection seems ready to be made between Lie groups that admit discrete series representations and the study of automorphic cohomology on quotients of Mumford Tate domains by arithmetic groups Bringing together complex geometry representation theory and arithmetic this book opens up a fresh perspective on an important subject
