Evolution of Sexual Reproduction in Marine Invertebrates Andrew (Andrey N.) Ostrovsky, 2013-12-16 Three major aspects that distinguish this book are that 1 it contains the most detailed analysis of the sexual reproduction oogenesis fertilization and embryonic incubation in a particular phylum of the aquatic invertebrates Bryozoa ever made this analysis is based on an exhaustive review of the literature on that topic published over the last 260 years as well as extensive original histological anatomical and morphological data obtained during studies of both extant and extinct species 2 this broad analysis has made it possible to reconstruct the major patterns stages and trends in the evolution of sexual reproduction in various bryozoan clades showing numerous examples of parallelisms during transitions from broadcasting to embryonic incubation from planktotrophic to non feeding larvae and from lecithotrophy to placentation corresponding shifts in oogenesis fertilization and embryonic development are discussed in detail and 3 the key evolutionary novelties acquired by Bryozoa are compared with similar innovations that have evolved in other groups of marine invertebrates showing the general trends in the evolution of their sexual reproduction Ecological background of these innovations is considered too Altogether these aspects make the monograph an Encyclopedia of bryozoan sexual reproduction offering an integral picture of the evolution of this complex phenomenon

Patterns of Reproductive Behavior Desmond Morris, 1970 **Reproductive Behavior** William Montagna, 1974-09-01 Sexual compatibility between male and female partners is indispensable to normal and successful fertilization in mammals Thus the genes from males and females whose sexual behavior is characterized by awkwardness ineptness and miscues are eliminated from the gene pool of the species In human societies this compatibility is not always evident and the behavior that precedes and accompanies copulation and fertilization is exceedingly complex and affected by many variables As in most other species of animals the entire repertoire of reproductive behavior of man is not well understood by man When viewed, discussed or reported the topic is too often and most unfortunately regarded as an amalgam of emotion mysticism and biology In the past such emotion charged approaches to the biological fact of reproduction did much to obfuscate the subject and as a result much of the array of hormonal neural psychological and social variables that control and insure the successful reproduction of the human species remains even now in Victorian ignorance But with the recent rash of books and scientific treatises on the subject some progress has been made in elucidating human reproduction and associated sexual behavior However so entrenched are some of our social taboos that the danger still lurks

of equating social acceptance of the words with an understanding all too lacking of the process to which they refer Human Reproduction and Sexual Behavior Charles W. Lloyd, 1964 **Asdell's Patterns of Mammalian Reproduction** Virginia Douglass Hayssen, Ari Van Tienhoven, Ans Van Tienhoven, 1993 Since the appearance of the second edition of Sydney A Asdell's widely used *Patterns of Mammalian Reproduction* in 1964 the field of reproductive physiology has expanded dramatically Accordingly this revision adopts a different structure from previous editions substituting empirical delineations for physiological interpretations With the emphases now on a presentation of the published facts of mammalian reproduction it provides a thorough compilation of what is known about the basic reproductive biology of each of the 4300 mammalian species To gather information the authors examined more than 20 000 publications dating up to 1992 They used primary sources as much as possible supplementing them with English translations of Russian Finnish Chinese and Japanese journals The data are presented in taxonomic order Each familial account summarizes the pattern of reproduction for the family and provides lists of citations arranged by topic of the literature on the endocrinology reproductive anatomy and reproductive physiology of the family Following each account is a tabular listing of species specific data for neonatal mass and size weaning mass and size litter size age at sexual maturity estrous cycle length gestation length lactation length number of litters per year and seasonality of reproduction For each of these reproductive variables the range of data gleaned from the literature is given together with the source of each value listed Virginia Hayssen is Assistant Professor of Biology at Smith College Ari Van Tienhoven is Professor of Animal Physiology Emeritus at Cornell University Ans Van Tienhoven assisted in the compilation of data for the book Photosynthate Allocation Patterns and Mode of Postfire Reproduction in Two Shrub Species from the California Chaparral Steven Richard Sparks, 1989 Age specific patterns of photosynthate allocation in leaves were investigated for two chaparral shrubs *Adenostoma fasciculatum* and *Ceanothus greggii* in five stands of various ages i e years since the previous fire Branches of shrubs were labeled with $^{14}\text{CO}_2$ and seasonal allocation of ^{14}C labeled photosynthate to storage defense metabolic and structural compounds was followed Age specific allocation patterns were found only in the spring when older shrubs showed a reduced allocation of photosynthate within leaves to storage compounds Older shrubs may be less able than younger shrubs to allocate photosynthate to storage compounds when demands on photosynthate for growth are high This pattern indicates that there may be some physiological basis for the observation of chaparral senescence The influence of this senescence on postfire sprouting was investigated by quantifying the proportion of standing dead biomass in *A fasciculatum* as well as other shrub structural characteristics before an experimental burn After the burn sprout production during the first postfire season was determined and correlated with prefire structural characteristics Shrubs that had high proportions of dead biomass before the fire tended to show less postfire sprout production per unit prefire shrub size Additionally shrubs which were large before the fire tended to be large after the fire Photosynthate allocation to shoots and roots was investigated for seedlings of both species For seedlings of *C greggii*

increased proportional allocation of labeled photosynthate belowground was always accompanied by an increase in the root shoot ratio But A fasciculatum seedlings during the second season of growth showed an increase in the proportional allocation of labeled photosynthate to roots which was not manifested as an increase in the root shoot ratio Seedlings of A fasciculatum a sprouting shrub may be accumulating photosynthate belowground as nonstructural carbohydrates necessary to support eventual postfire sprouting Seedlings of C greggii an obligate seeding species did not appear to have this constraint The accumulation of nonstructural carbohydrates belowground to support sprouting may be a cost of sprouting that obligate seeding species are able to avoid

Electricity and Life Edward Cornelius Towne,1887 **Self Culture**,1895 **Animal Behavior Abstracts** ,1996 Pamphlets on Biology ,1887 **Reproductive Strategies and Developmental Patterns in Annelids** Adriaan W.C. Dorresteijn,Wilfried Westheide,2013-04-18 The fascination of the Annelida to scientists lies in the beauty of their structures and the functionality of their body plan the tremendous adaptive radiation which has made it possible for these animals to colonize almost all marine limnic and terrestrial biotopes In doing so they have evolved a great variety of life forms and their reproduction and development are correspondingly diverse with many modes and patterns unique in the animal kingdom In this special volume recent progress in this broad research area is presented by 26 specialists in general through surveys or treatments of selected examples Some of them review important annelid taxa such as the Nereididae Syllidae Spionidae Cirratulidae Clitellata and Pogonophora others analyse reproductive and developmental structures and phenomena in annelids e g segmental organs sex pheromones oogenesis mating systems sperm types life cycles larval settlement cleavage and symmetry of embryos or discuss controversial approaches to annelid systematics The book will be of interest to all zoologists who work with annelids as well as to embryologists and other researchers in reproductive biology **Oceanic Birds of South America** Robert Cushman Murphy,1936
