*Programming Language Implementation and Logic Programming* Maurice Bruynooghe, Martin Wirsing, 1992 This volume contains the papers accepted for presentation at the Fourth International Symposium on Programming Language Implementation and Logic Programming PLILP 92 held in Leuven Belgium August 26 28 1992 The aim of the symposium was to explore new declarative concepts methods and techniques relevant for implementation of all kinds of programming languages whether algorithmic or declarative The symposium gathered researchers from the fields of algorithmic programming languages as well as logic functional and object oriented programming The topics discussed in the volume include Declarative implementation techniques Implementation of declarative concepts and modules Compiler specification and construction Program transformation Programming environments for declarative languages Amalgamation of logic programming with algorithmic functional or object oriented techniques Executable specification PUBLISHER S WEBSITE

*Logic Program Synthesis and Transformation* Yves Deville, 2012-12-06 This volume contains extended versions of papers presented at the Third International Workshop on Logic Program Synthesis and Transformation LOPSTR 93 held in Louvain la Neuve in July 1993 Much of the success of the workshop is due to Yves Deville who served as Organizer and Chair Many people believe that machine support for the development and evolution of software will play a critical role in future software engineering environments Machine support requires the formalization of the artifacts and processes that arise during the software lifecycle Logic languages are unique in providing a uniform declarative notation for precisely describing application domains software requirements and for prescribing behavior via logic programs Program synthesis and transformation techniques formalize the process of developing correct and efficient programs from requirement specifications The natural intersection of these two fields of research has been the focus of the LOPSTR workshops The papers in this volume address many aspects of software development including deductive synthesis inductive synthesis transformations for optimizing programs and exploiting parallelism program analysis techniques particularly via abstract interpretation meta programming languages and tool support and various extensions to Prolog like languages admitting non Horn clauses functions and constraints Despite the progress represented in this volume the transition from laboratory to practice is fraught with difficulties

*Programming Languages Implementation and Logic Programming*, 1992 *Language Prototyping: An Algebraic Specification Approach* Jan Heering, Paul Klint, Arie Van Deursen, 1996-09-30 Language prototyping provides a means to generate language implementations automatically from high level language definitions This volume presents an algebraic specification approach to language prototyping and is centered around the ASF SDF formalism and Meta Environment The volume is an integrated collection of articles covering a number of case studies and includes several chapters proposing new techniques for deriving advanced language implementations The accompanying software is freely

available **Multiparadigm Constraint Programming Languages** Petra Hofstedt,2011-06-16 Programming languages are often classified according to their paradigms e g imperative functional logic constraint based object oriented or aspect oriented A paradigm characterizes the style concepts and methods of the language for describing situations and processes and for solving problems and each paradigm serves best for programming in particular application areas Real world problems however are often best implemented by a combination of concepts from different paradigms because they comprise aspects from several realms and this combination is more comfortably realized using multiparadigm programming languages This book deals with the theory and practice of multiparadigm constraint programming languages The author first elaborates on programming paradigms and languages constraints and the merging of programming concepts which yields multiparadigm constraint programming languages In the second part the author inspects two concrete approaches on multiparadigm constraint programming the concurrent constraint functional language CCFL which combines the functional and the constraint based paradigms and allows the description of concurrent processes and a general framework for multiparadigm constraint programming and its implementation Meta S The book is appropriate for researchers and graduate students in the areas of programming and artificial intelligence
