EXERCISES

1. *Production Planning*. The Bogard Corporation produces three types of bookcases, which it sells to large office supply companies. The production of each bookcase requires two machine operations, trimming and shaping, followed by assembly, which includes inspection and packaging. All three types require 0.4 hours of assembly time, but the machining operations have different processing times, as shown below, in hours per unit:

	Standard	Narrow	Wide
Trimmer	0.2	0.4	0.6
Shaper	0.6	0.2	0.5

Each machine is available 150 hours per month, and the current size of the assembly department provides capacity of 600 hours. Each bookcase produced yields a unit profit contribution as follows:

	Standard	Narrow	Wide
Profit	\$8	\$6	\$10

- What are the optimal production quantities for the company?
- What is the pattern in the optimal allocation?

2. *Fertilizing the Lawn*. The facilities manager at Oxbridge University is planning to apply fertilizer to the grass in the quadrangle area in the spring. The grass needs nitrogen, phosphorus, and potash in at least the amounts given in the following table.

Mineral	Minimum Weight (lb)
Nitrogen	12
Phosphorus	14
Potash	18

Three kinds of commercial fertilizer are available, with mineral content and prices per 1,000 pounds as given in the following table. There is virtually unlimited supply of each kind of fertilizer.

Fertilizer	Nitrogen Content (lb)	Phosphorus Content (lb)	Potash Content (lb)	Price (\$)
A	20	10	5	10
B	10	5	15	8
C	15	10	5	7

How much of each fertilizer should be purchased to satisfy the requirements at minimum cost?

3. *Coordinating Production and Marketing*. The Andrews Apple Products Company purchases apples from local growers and makes applesauce and apple juice. It costs \$0.80 to produce a jar of applesauce and \$0.60 to produce a bottle of apple juice. The company has a policy that at least 20 percent but not more than 60 percent of its output must be applesauce.

The company wants to meet but not exceed the demand for each product. The marketing manager estimates that the demand for applesauce is a maximum of 5,000 jars, plus an additional 3 jars for each \$1 spent on advertising for applesauce. The maximum demand for apple juice is estimated to be 4,000 bottles, plus an additional 5 bottles for every \$1 spent on advertising for apple juice. The company has \$16,000 to spend on producing and advertising its two products. Applesauce sells for \$1.75 per jar; apple juice sells for \$1.75 per bottle. The company wants to know how many units of each product to produce, and how much advertising to spend on each product, in order to maximize profit.

- What are the optimal quantities of applesauce and apple juice for Andrews to produce? (Rounding off is acceptable.)
- What is the optimal amount to spend on advertising? What is the optimal profit?
- Describe the qualitative pattern in the solution.

4. *Managing a Portfolio*. A local bank wants to build a bond portfolio from a set of four bonds with \$1 million available for investment. The expected annual return, the worst-case annual return on each bond, and the “duration” of each bond are given in the following table. (The duration of a bond is a measure of the bond’s sensitivity to changes in interest rates.)
