

SAMPLING METHODS FOR CENSUSES AND SURVEYS

CHAPTER I

THE PLACE OF SAMPLING IN CENSUS WORK

1.1 The sampling process

Sampling, that is, the selection of part of an aggregate of material to represent the whole aggregate, is a long-established practice. Simple examples are provided by a handful of grain taken from a sack, or a piece of cloth cut off a roll. In these cases little attention need be paid to the selection process, since the whole of the material is similar or well-mixed, and any part of it if not too small is likely to be closely representative of the whole. When, however, the aggregate to be sampled consists of units which are somewhat dissimilar amongst themselves, and which are not well-mixed, a small sample of these units may not be representative of the whole aggregate. Even if units are selected from different parts of the aggregate, and other suitable precautions are taken, the sample is likely to a certain extent to be unrepresentative owing to the chance inclusion of an undue proportion of units of a particular type. It will clearly not be representative if units of a particular type are chosen deliberately to the exclusion of other types, or if the process of selection is such that certain types of unit are favoured at the expense of others. Thus in sampling a heap of coal by taking a few shovelfuls from the edges, too great a proportion of the large lumps will be obtained, since the large lumps tend to roll down the sides and be distributed round the edges of the heap. Similarly in the sampling of continuous material, a single portion, even if quite large, may not be adequately representative; a piece of cloth cut off the end of a roll in which the quality of the weaving varies progressively, will not form an adequate sample of the whole roll.

Census and survey work is normally carried out on material made up of dissimilar units. Censuses of population, censuses of industrial production, and censuses of agriculture have the common feature that the aggregate of material embraces a large number of separate units which are often markedly dissimilar in various respects. In many cases the purposes for which the information is required are adequately served if a proportion only of the units are covered, but because of the dissimilarity of the different units neither
