Modeling and Parameter Estimation in Respiratory Control M.C.K. Khoo, 2012-12-06 Experimentalists tend to revel in the complexity and multidimensionality of biological processes Modelers on the other hand generally look towards parsimony as a guiding principle in their approach to understanding physiological systems It is therefore not surprising that a substantial degree of miscommunication and misunderstanding still exists between the two groups of truth seekers However there have been numerous instances in physiology where the marriage of mathematical modeling and experimentation has led to powerful insights into the mechanisms being studied Respiratory control represents one area in which this kind of cross pollination has proven particularly fruitful While earlier modeling efforts were directed primarily at the chemical control of ventilation more recent studies have extended the scope of modeling to include the neural and mechanical aspects pertinent to respiratory control As well there has been a greater awareness of the need to incorporate interactions with other organ systems Nevertheless it is necessary from time to time to remind experimentalists of the existence of modelers and vice versa The 4th Annual Biomedical Simulations Resource BMSR Short Course was held in Marina Del Rey on May 21-22 1989 to acquaint respiratory physiologists and clinical researchers with state of the art methodologies in mathematical modeling experiment design and data analysis as well as to provide an opportunity for experimentalists to challenge modelers with their more recent findings *Biomedical Research Technology Resources*, 1990 *NIH Publication*, 1990 **Resources for Biomedical Research Technology**, 1993-10 *Biomedical Engineering of Pancreatic, Pulmonary, and Renal Systems, and Applications to Medicine* Dhanjoo N.
