Operations Management Of Distributed Service Networks A Practical Quantitative Approach:

Operations Management of Distributed Service Networks Niv Ahituv, Oded Berman, 2012-12-06 Distributed service networks encompass various facilities with which we have daily contact. In the public sector they include, for instance, ambulance, fire, and police services; in the business sector they include maintenance and repair services, road services, courier services, and the like. Policy-making problems in distributed service networks can be clearly classified into a number of hierarchical levels. The levels are distinguished by the time horizon of the problem, by the amount of cost involved in the implementation of a solution, and by the political implications of the solution. This top-down classification is typical of what is known as the systems approach, advocating that the direction of the analysis of complex systems should be from the whole to the details. The top-down classification consists of the following categories of policies: 1. Zoning: How should a network be partitioned into subzones? 2. Station location: Where should service stations or service units be located? 3. Resource allocation: What amount of resources should be allocated to the stations? vii, viii Preface 4. Dispatching, routing, and repositioning: What is the optimal dispatching policy? What are the optimal routes for nonbusy units, and under what circumstances is it worthwhile to reposition a certain idle unit? A top-down approach implies that each of the problems is solved separately; however, the solution of a higher-level problem sets constraints on problems at lower levels.

Location Theory and Decision Analysis
Yupo Chan, 2011-08-26 Employing state-of-the-art quantitative models and case studies, *Location Theory and Decision Analysis* provides the methodologies behind the siting of such facilities as transportation terminals, warehouses, housing, landfills, state parks, and industrial plants. Through its extensive methodological review, the book serves as a primer for more advanced texts on spatial analysis, including the monograph on *Location, Transport, and Land Use* by the same author. Given the rapid changes over the last decade, the Second Edition includes new analytic contributions as well as a software survey of analytics and spatial information technology. While the First Edition served the professional community well, the Second Edition has substantially expanded its emphasis for classroom use. Extensive pedagogic materials have been added, going from the fundamental principles to open-ended exercises, including solutions to selected problems. The text is of value to engineering and business programs that offer courses in Decision and Risk Analysis, Multicriteria Decision Making, and Facility Location and Layout. It should also be of interest to public policy programs that use geographic Information Systems and satellite imagery to support their analyses.

Location, Transport and Land-Use
Yupo Chan, 2005-12-05 1 Theme and focus: Few books are available to integrate the models for facilities siting, transportation, and land use. Employing state-of-the-art quantitative models and case studies, this book would guide the siting of such facilities as transportation terminals, warehouses, nuclear power plants, military bases, landfills, emergency shelters, state parks, and industrial plants. The book also shows the use of statistical tools for forecasting and analyzing implications of land use decisions. The idea is that land use on a map is necessarily a consequence of individual and often conflicting siting decisions over time. Since facilities often

develop to form a community these decisions are interrelated spatially i e they need to be accessible to one another via the transportation system It is our thesis that a common methodological procedure exists to analyze all these spatial temporal constructs While there are several monographs and texts on subjects related to this book s this volume is unique in that it integrates existing practical and theoretical works on facility location transportation and land use Instead of dealing with individual facility location transportation or the resulting land use pattern individually it provides the underlying principles that are behind these types of models Particularly of interest is the emphasis on counter intuitive decisions that often escape our minds unless deliberate steps of analysis are taken Oriented toward the fundamental principles of infrastructure management the book transcends the traditional engineering and planning disciplines where the main concerns are often exclusively either physical design fiscal socioeconomic or political considerations

Combinatorial And Global Optimization Rainer E Burkard, Athanasios Migdalas, Panos M Pardalos, 2002-04-05 Combinatorial and global optimization problems appear in a wide range of applications in operations research engineering biological science and computer science In combinatorial optimization and graph theory many approaches have been developed that link the discrete universe to the continuous universe through geometric analytic and algebraic techniques Such techniques include global optimization formulations semidefinite programming and spectral theory Recent major successes based on these approaches include interior point algorithms for linear and discrete problems the celebrated Goemans Williamson relaxation of the maximum cut problem and the Du Hwang solution of the Gilbert Pollak conjecture Since integer constraints are equivalent to nonconvex constraints the fundamental difference between classes of optimization problems is not between discrete and continuous problems but between convex and nonconvex optimization problems This volume is a selection of refereed papers based on talks presented at a conference on Combinatorial and Global Optimization held at Crete Greece

Software Failure Risk Susan A. Sherer, 2012-12-06 The author here presents a detailed explanation of the methodology of software reliability evaluation and then demonstrates its applications to a commercial loan system a funds transfer security system and a payables processing system Her well written practical text enables users to design original software modules as well as to critically assess commercial software products
