Optical Diagnostics For Flow Processes:

Optical Diagnostics for Flow Processes P. Buchhave, L. Lading, G. Wigley, 2013-07-18 The origin of optical methods for fluid flow investigations appears to be nontraceable This is no matter for surprise After all seeing provides the most direct and common way for humans to learn about their environment But at the same time some of the most sophisticated methods for doing measurements in fluids are also based on light and often laser light A very large amount of material has been published in this area over the last two decades Why then another publication Well the field is still in a state of rapid development It is characterised by the use of results and methods developed within very different areas like optical physics spectroscopy communication systems electronics and computer science mechanical engineering chemical engineering and of course fluid dynamics We are not aware of a book containing both introductory and more advanced material that covers the same material as presented here The book is the result of a compilation and expansion of material presented at a summer school on Optical Diagnostics for Flow Processes held at RiS0 National Laboratory and the Technical University of Denmark in September 1993 The aim of the course was to provide a solid background for understanding evaluating and using modern optical diagnostic methods addressing Ph D students and researchers active in areas of fluid flow research The disciplines represented by the participants ranged from atmospheric fluid dynamics to biomedicine

Process Imaging For Automatic Control David M. Scott, Hugh McCann, 2018-10-03 As industrial processes and their corresponding control models increase in complexity the data provided by traditional point sensors is no longer adequate to ensure product quality and cost effective operation Process Imaging for Automatic Control demonstrates how in process imaging technologies surpass the limitations of traditional monitoring systems by providing real time multidimensional measurement and control data Combined with suitable data extraction and control schemes such systems can optimize the performance of a wide variety of industrial processes Contributed by leading international experts Process Imaging for Automatic Control offers authoritative comprehensive coverage of this new area of process control technology including Basic goals of process modeling and their application to automatic control Direct imaging devices and applications such as machine vision and spatial measurement of flow velocity pressure shear pH and temperature Various techniques hardware implementations and image reconstruction methods for process tomography Image enhancement and restoration State estimation methods State space control system models control strategies and implementation issues Five chapters devoted to case studies and advanced applications From theory to practical implementation this book is the first to treat the entire range of imaging techniques and their application to process control Supplying broad coverage with more than 270 illustrations and nearly 700 cited references it presents an accessible introduction to this rapidly growing interdisciplinary technology

Scientific and Technical Aerospace Reports, 1994 *Optical Techniques in Fluid, Thermal and Combustion Flow*, 1997 **Flow & particle diagnostics**, 1987 *Instrumentation for Flows with Combustion* A. M. K. P. Taylor, 1993 Several instruments

mostly optical have recently become available complimenting progress in computational techniques and contributing to the evaluation of models of turbulence and combustion This book summarizes the state of the art of the more important instruments in seven chapters Each includes essential theory but concentrates on the instruments potential by reference to measurement examples Optical Diagnostics in Energy Conversion Processes Ruike Bi,2024 This thesis presents development in optical diagnostics for studies of energy conversion processes Work has been done in characterization of electrode wear in spark plugs multi species high speed tomographic laser induced fluorescence high speed diagnostics in lab scale gas turbine burners and surface temperature measurements on gas turbine burner injection nozzles A new method of monitoring erosion of the electrodes in spark plugs made from nickel has been established based on the emission of Ni atoms in the 339 360 nm spectral range Spectral study revealed the spectral range in which high intensity of Ni atomic emission can be observed while low intensity of background emission is present An excitation scan has shown that laser excitation at Ni s 336 957 nm absorption line can induce the most optimum signal to noise ratio in the desired detection window The fluorescence lifetime of the found excitation scheme has been measured reporting an effective fluorescence lifetime of approximately 1 1 ns which was not seen to be changing as the spark discharge plasma decays It has been further established that the integrated fluorescence intensity of the current excitation scheme is proportional to the Ni atom number density Such findings have created a solid foundation for further 2D studies on the generation of Ni atoms from the spark discharge and erosion of the electrodes The construction of an injection seeded OPO producing signal wavelength at 609 nm pumped by a high speed burst mode laser system has been described A routine of alignment of the OPO cavity has been established and described in detail in the thesis Using the same laser system quasi simultaneous 10 kHz tomographic LIF measurement of anisole and formaldehyde has been successfully performed where only two sets of high speed CMOS and image intensifier were used for acquisition of 8 views from different angles thanks to the application of an improved sensor splitting strategy The eight acquired views were successfully placed on the same horizontal plane also due to the improved strategy A novel imaging timing design succeeded in the quasi simultaneous acquisition of fluorescence signal from two species on the same imaging sensor High speed formaldehyde planar laser induced fluorescence measurements have shown insufficient droplet breakup and evaporation in a Triple Annular Research Swirler burner using ethanol as fuel High amount of ethanol droplets has been observed in the LIF sequences In addition it has been shown that excess formaldehyde was trapped in the outer recirculation zone The averaged flow structure in the outer recirculation zone has been demonstrated by optical flow estimation performed on the acquired formaldehyde LIF sequence Finally a study on the injection nozzle surface temperature of a lab scaled gas turbine burner has been presented A galvo system was used for automated temperature measurement on a 2D array of points on the burner surface It was found that the surface temperature of the injection nozzle was affected by the cooling from the supplied fresh gas and heating from the flame Specifically increased heating could be

observed when a flame attached to the injection nozzle Measurement Techniques in Heat and Mass Transfer Rem
