Optical Properties of Solids Anthony Mark Fox, 2001 This book gives an introduction to the optical properties of solids including many new topics that have not been previously covered in other solid state texts at this level The fundamental principles of absorption reflection luminescence and light scattering are discussed for a wide range of materials including crystalline insulators and semiconductors glasses metals and molecular materials Classical and quantum models are used where appropriate along with recent experimental data Examples include semiconductor quantum wells organic semiconductors vibronic solid state lasers and nonlinear optics

**Materials Science of Carbides, Nitrides and Borides** Yury G. Gogotsi, R.A. Andrievski, 2012-12-06 A survey of current research on a wide range of carbide nitride and boride materials covering the general issues relevant to the development and characterisation of a variety of advanced materials Topics include structure and electronic properties modeling processing high temperature chemistry oxidation and corrosion mechanical behaviour manufacturing and applications The volume complements more specialised books on specific materials as well as more general texts on ceramics or hard materials presenting a survey of materials research as a key to technological development After decades of research the materials are being used in electronics wear resistant refractory and other applications but numerous new applications are possible Roughly equal numbers of papers cover theoretical and experimental research in the general field of materials science of refractory materials Audience Researchers and graduate students in materials science and engineering

**Optical Properties of Solids** Mark Fox, 2010-03-26 The second edition of this successful textbook provides an up to date account of the optical physics of solid state materials The basic principles of absorption reflection luminescence and light scattering are covered for a wide range of materials including insulators semiconductors and metals The text starts with a review of classical optics and then moves on to the treatment of optical transition rates by quantum theory In addition to the traditional discussion of crystalline materials glasses and molecular solids are also covered The first edition included a number of subjects that are not normally covered in standard texts notably semiconductor quantum wells molecular materials vibronic solid state lasers and nonlinear optics The basic structure of the second edition is unchanged but all of the chapters have been updated and improved Furthermore a number of important new topics have been added including Optical control of spin Quantum dots Plasmonics Negative refraction Carbon nanostructures graphene nanotubes and fullerenes NV centres in diamond The text is aimed at final year undergraduates masters students and researchers It is mainly written for physicists but might also be useful for electrical engineers materials scientists and physical chemists The topics are written in a clear tutorial style with worked examples chapter summaries and exercises A solutions manual is available on request for instructors

Optical Properties of Solids S. Mitra, 2013-04-17 This book is an account of the manner in which the optical phenomena observed from solids relate to their fundamental properties Written at the graduate level it attempts a threefold

purpose an indication of the breadth of the subject an in depth examination of important areas and a text for a two semester course The first two chapters present introductory theory as a foundation for subsequent reading The following ten chapters broadly concern electronic properties associated with semiconductors ranging from narrow to wide energy gap materials Lattice properties are examined in the remaining chapters in which effects governed by phonons in perfect crystals point defects their vibrational and electronic spectra and electron phonon interactions are stressed Fun and hard work both in considerable measure have gone into the preparation of this volume At the University of Freiburg W Germany from August 7 20 1966 the occasion of a NATO Advanced Study Institute on The Optical Properties of Solids the authors of these various chapters lectured for the Institute this volume provides essentially the Proceedings of that meeting Many major revisions of original lectures contractions and enlargements were required for better organization and presentation of the subject matter Several abbreviated chapters appear mainly to indicate the importance of their contents in optical properties research and to indicate recently published books that provide ample coverage We are indebted to many people the authors for their efforts and patience our host at the University of Freiburg the late Professor Dr **Technical Report** Massachusetts Institute of Technology.
