Optical Communications Components Syst:

Optical Communications Jürgen Franz, Virander K. Jain, 2000 The advantages of optical communications are many ultra high speed highly reliable information transmission and cost effective modulation and transmission links to name but a few It is no surprise that optical fiber communications systems are now in extensive use all over the world Along with software and microelectronics optical communication represents a key technology of modern telecommunication systems Optical Communications Components and Systems provides the basic material required for advanced study in theory and applications of optical fiber and space communication systems After a review of some fundamental background material component based chapters discuss all relevant passive and active optical and optoelectronic components used in point to point links and in networks Systems chapters address the analysis and optimization of both incoherent and coherent systems introduce fiber optic link design and discuss physical limits The authors also provide an overview of applications such as optical networks and optical free space communications The advanced interactive multimedia communications of today and the future rely on optical fiber and space communication techniques Optical Communications Components and Systems offers engineers and physicists a working reference for the selection and design of optical communication systems and provides engineering students with a valuable text that prepares them for work in this essential and rapidly growing field

Optical Communications: Components and Systems Josephine Winston, 2023-09-26 Optical communication refers to any type of communication that uses light to carry information An optical communication system is composed of three major components which include a transmitter channel and receiver Transmitter is used to encode a message into an optical signal Semiconductor devices such as light emitting diodes LEDs and laser diodes are the most commonly used transmitters The function of a channel is to carry the signal to its destination Receiver is a component that reproduces the message from the received optical signal Modern communication relies on optical networking systems which use optical fiber optical amplifiers lasers switches and routers The most common type of channel used for optical communications is the optical fiber The light in an optical fiber is guided by the principle of total internal reflection The main advantages of optical communication include high bandwidth exceptionally low loss large transmission range and no electromagnetic interference This book includes some of the vital pieces of work being conducted across the world on various topics related to optical communications It will serve as a valuable source of reference for graduate and postgraduate students Optical Communications Jürgen H.
