Francesca Talpo, Navjot Kaur, Gerardo Rosario Biella, 2023-06-08 Oxytocin is a pituitary hormone able to produce a multitude of heterogeneous central and peripheral responses Within the central nervous system oxytocin is synthesized by the hypothalamic parvocellular neurons and released in many different brain areas where it acts as a neuromodulator It exerts pro social and anxiolytic effects by promoting attachment trust maternal bonding social affiliation and eating and metabolic functions Imbalances in the oxytocinergic system are implicated in neuropsychiatric diseases associated with altered socio emotional competence such as autism spectrum disorder clinical depression and eating disorders Also oxytocin impairments could affect memory formation persistence and they have been found in some neurodegenerative diseases such as Alzheimer s disease and in several cancers Although substantial progress has been achieved in understanding single pieces of the complex neurobiology of the oxytocinergic system the puzzle is far from being complete It is still unclear how this single neuropeptide could exert such pleiotropic neuromodulatory effects Extending the comprehension of the mechanisms underlying the complex roles of the oxytocin will be of great interest as this molecule has the potentiality to be used as a drug treatment

Intersensory Perception and Sensory Integration

Richard D. Walk, Herbert L. Pick, 1981-05-31 This volume on intersensory perception and sensory integration is the second volume of the series Perception and Perceptual Development A Critical Review Series The topic of the volume is timely for in recent years many investigators have noted that information about any natural event is obtained by a perceiver from a variety of sources Such an observation immediately leads to the question of how this information is synthesized and organized Of course the implication that there are several discrete input channels that must be processed has come under immediate attack by researchers such as the Gibsons They find it extremely artificial to regard natural information as being cut up and requiring cementing Nevertheless the possibility that during ontogenesis perception involves the integration of separate information has attracted the attention of scholars concerned with both normal and abnormal development In the case of normal development a lively controversy has arisen between those who believe perceptual development goes from integration toward differentiation and those who hold the opposite view In the case of abnormal psychological development such as learning disabilities many workers have suggested that perceptual integration is at fault In thinking about the issues raised in this volume we are particularly indebted to our former teachers and colleagues Eleanor and James Gibson T A Ryan Robert B MacLeod and Jerome Bruner We are pleased to acknowledge the secretarial help of Karen Weeks in the preparation of this volume
