Всі економічні моделі мають певні спільні риси: мають передбачатися оптимізуючі рішення на рівні осіб, які приймають рішення, та результуюча рівновага внаслідок взаємодії всіх цих рішень на агрегованому рівні. Крім того, рішення мають підлягати деякому ресурсному обмеженню. Теорія конфлікту є не просто однією з гілок економічного аналізу чи набором схожих тем злочинності, трудових спорів, судочинства, а мікроекономічним підходом до досягнення односторонньої переваги замість взаємних переваг. Якщо теорія макроекономічного аналізу і теорія мікроекономічного аналізу передбачають звичайні процеси виробництва, за допомогою яких ресурсні входи перетворюються у бажані товари, то теорія конфлікту передбачає технологію протиборства і боротьби. У процесі конфлікту роль входів виконують зусилля військових дій, які генерують виходи у формі кінцевого розподілу ресурсів і доходів між усіма сторонами.

All economic models have certain features in common: there must be optimizing decisions at the level of decision-makers and the resulting equilibrium due to the interaction of all these decisions at the aggregate level. In addition, decisions should be subject to some resource constraint. Conflict theory is not just one of the branches of economic analysis or a set of similar topics of crime, labor disputes, litigation, but a microeconomic approach to achieving unilateral advantage instead of mutual advantage. If the theory of macroeconomic analysis and the theory of microeconomic analysis involve the usual processes of production, through which resource inputs are transformed into desirable goods, the theory of conflict involves the technology of confrontation and struggle. In the process of conflict, the role of inputs is played by military efforts, which generate outputs in the form of the final distribution of resources and incomes among all parties. The shape of the settlement possibilities curve may indicate that these parties' opportunities are complementary and harmonious: both parties can gain by working together, and the largest aggregate outcome is achieved when the parties have approximately equal benefits. The negative slope of a party's indifference curve indicates the party's preferences for cooperation. The shape of the adjustment possibilities curve may indicate that these parties' possibilities are disharmonious, when roughly equal distributions of income yield less aggregate outcome than unequal distributions. Although ex-post transfers may divide the aggregate outcome more evenly, all such possibilities are accounted for by the shape of the settlement possibility curve. A positive slope of a party's indifference curve indicates this party's reluctance to cooperate. Both par-

because it can lead to less expensive and more accurate political analysis This knowledge can then be used to interpret political analysis This knowledge can then be used to interpret political behavior and guide policymakers decision processes The challenge is to create a tractable method that retains political meaning and preserves enough information of the underlying dynamic system so as to support the development of predictive models We first discuss an external data analysis method that models the complex social system of international interactions Then we describe two internal dynamics models and create our own model based on consensus protocols that is capable of showing stable disagreement We verify this model by simulating the dynamics of the Israeli Palestinian Conflict Our model shows some promise of being an accurate representation of the computation mechanisms underlying complex social multi agent systems *The New Geopolitics* Michael Don Ward,1992 First Published in 1992 Routledge is an imprint of Taylor Francis an informa company
