Modelling Biological Populations In Space And Time:

Modelling Biological Populations in Space and Time Eric Renshaw, 1993-08-26 This volume develops a unifying approach to population studies emphasising the interplay between modelling and experimentation Throughout mathematicians and biologists are provided with a framework within which population dynamics can be fully explored and understood Aspects of population dynamics covered include birth death and logistic processes competition and predator prey relationships chaos reaction time delays fluctuating environments spatial systems velocities of spread epidemics and spatial branching structures Both deterministic and stochastic models are considered Whilst the more theoretically orientated sections will appeal to mathematical biologists the material is presented so that readers with little mathematical expertise can bypass these without losing the main flow of the text

Modelling Biological Populations in Space and Time Eric Renshaw, 1993 *Frontiers of Population Ecology* R. B. Floyd, Andrew Walter Sheppard, Paul Joseph De Barro, 1996 This book provides a contemporary view of the major issues facing ecologists and outlines some of the strengths and weaknesses of the current ecological framework and its utility in managing biological systems It includes contributions from world experts and looks at important themes including theoretical and experimental population ecology the conservation of endangered species the management of pests and the sustainable management of resources The chapters deal with a wide range of organisms including plants pathogens insects molluscs birds marine and terrestrial mammals New technologies and approaches are also covered

Unifying Themes In Complex Systems Yaneer Bar-yam,1999 The study of complex systems has attracted a broad range of researchers from many disciplines spanning both the hard and soft sciences In the Autumn of 1997 300 of these researchers came together for the First International Conference on Complex Systems The proceedings of this conference is the first book in the New England Complex Systems Institute series on Complexity and includes more than 100 presentations and papers on such topics as evolution emergence complexity self organisation scaling informatics time series emergence of mind and engineering of complex systems This research is expected to be a precursor to an explosive growth of interest in this field

Spatial Dynamics and Pattern Formation in Biological Populations Ranjit Kumar Upadhyay, Satteluri R. K. Iyengar,2021 The book provides an introduction to deterministic and some stochastic modeling of spatiotemporal phenomena in ecology epidemiology and neural systems A survey of the classical models in the fields with up to date applications is given The book begins with detailed description of how spatial dynamics diffusive processes influence the dynamics of biological populations These processes play a key role in understanding the outbreak and spread of pandemics which help us in designing the control strategies from the public health perspective A brief discussion on the functional mechanism of the brain single neuron models and network level with classical models of neuronal dynamics in space and time is given Relevant phenomena and existing modeling approaches in ecology epidemiology and neuroscience are introduced which provide examples of pattern formation in these models The analysis of patterns enables us to study the dynamics of macroscopic and microscopic behaviour of underlying systems and travelling wave type patterns observed in dispersive systems Moving on to virus dynamics authors present a detailed analysis of different types models of infectious diseases including two models for influenza five models for Ebola virus and seven models for Zika virus with diffusion and time delay A Chapter is devoted for the study of Brain Dynamics Neural systems in space and time Significant advances made in modeling the reaction diffusion systems are presented and spatiotemporal patterning in the systems is reviewed Development of appropriate mathematical models and detailed analysis such as linear stability weakly nonlinear analysis bifurcation analysis control theory numerical simulation are presented Key Features Covers the fundamental concepts and mathematical skills required to analyse reaction diffusion models for biological populations Concepts are introduced in such a way that readers with a basic knowledge of differential equations and numerical methods can understand the analysis The results are also illustrated with figures Focuses on mathematical modeling and numerical simulations using basic conceptual and classic models of population dynamics Virus and Brain dynamics Covers wide range of models using spatial and non
