Stochastic Population Models James H. Matis, Thomas R. Kiffe, 2012-12-06 This monograph has been heavily influenced by two books One is Ren shaw s 82 work on modeling biological populations in space and time It was published as we were busily engaged in modeling African bee dispersal and provided strong affirmation for the stochastic basis for our ecological modeling efforts The other is the third edition of Jacques 28 classic book on compartmental analysis He reviews stochastic compartmental analysis and utilizes generating functions in this edition to derive many useful re sults We interpreted Jacques use of generating functions as a message that the day had come for modeling practioners to consider using this powerful approach as a model building tool We were inspired by the idea of using generating functions and related methods for two purposes The first is to integrate seamlessly our previous research centering in stochastic com partmental modeling with our more recent research focusing on stochastic population modeling The second related purpose is to present some key research results of practical application in a natural user friendly way to the large user communities of compartmental and biological population modelers One general goal of this monograph is to make a case for the practical utility of the various stochastic population models In accordance with this objective we have chosen to illustrate the various stochastic models using four primary applications described in Chapter 2 In so doing this mono graph is based largely on our own published work

Spatiotemporal Models of Population and Community Dynamics T. Czaran, 1998 This book presents a comprehensive typology and a comprehensible description of spatiotemporal models used in population dynamics The main types included are reaction diffusion systems patch models matapopulation approaches host parasitoid models cellular automata interacting particle systems tessellations and distance models The models are introduced through examples and with informative verbal explanations to help understanding Some of the cellular automation examples are models not yet published elsewhere Possible extensions of certain model types are suggested

Population Dynamics and the Tribolium Model: Genetics and Demography Robert F. Costantino, Robert A. Desharnais, 2012-12-06 The study of populations is becoming increasingly focused on dynamics We believe there are two reasons for this trend The ftrst is the impactof nonlinear dynamics with its exciting ideas and colorful language bifurcations domains of attraction chaos fractals strange attractors Complexity which is so very much a part of biology now seems to be also a part of mathematics A second trend is the accessibility of the new concepts Thebarriers tocommunicationbetween theoristandexperimentalistseemless impenetrable The active participationofthe experimentalist means that the theory will obtain substance Our role is the application of the theory of dynamics to the analysis ofbiological populations We began our work early in 1979 by writing an

ordinary differential equation for the rate of change in adult numbers which was based on an equilibrium model proposed a decade earlier. During the next few months we filled our notebooks with straightforward deductions from the model and its associated biological implications. Slowly some of the biological observations were explained and papers followed on a variety of topics: genetic and demographic stability, stationary probability distributions for population size, population growth as a birth-death process, natural selection and density-dependent population growth, genetic disequilibrium and the stationary stochastic dynamics of adult numbers.

An Introduction to Structured Population Dynamics J. M. Cushing, 1998-01-01 This monograph introduces the theory of structured population dynamics and its applications focusing on the asymptotic dynamics of deterministic models.

Population and Community Ecology for Insect Management and Conservation Johann Baumgartner, Pietro Brandmayr, Bryan F. J. Manly, 2020-03-09 One of the themes of the 20th International Congress of Entomology held in Florence in August 1996 was Ecology and Population Dynamics with papers presented on single species dynamics, population interactions and community ecology. This book contains a selection of the papers that were presented and gives a late 1990s picture of the latest research in this fast developing area.

Modelling Biological Populations in Space and Time Eric Renshaw, 1993-08-26 This volume develops a unifying approach to population studies emphasizing the interplay between modelling and experimentation. Throughout, mathematicians and biologists are provided with a framework within which population dynamics can be fully explored and understood. Aspects of population dynamics covered include birth, death and logistic processes, competition and predator-prey relationships, chaos, reaction time delays, fluctuating environments, spatial systems, velocities of spread, epidemics and spatial branching structures. Both deterministic and stochastic models are considered. Whilst the more theoretically orientated sections will appeal to mathematical biologists, the material is presented so that readers with little mathematical expertise can bypass these without losing the main flow of the text.

The Effects of Stochastic Variation in Population Parameters on Models of Intergenotypic Interactions Beverly Jane Berger, 1971

Spatial Ecology Stephen Cantrell, Chris Cosner, Shigui Ruan, 2009-08-05 Exploring the relationship between mathematics and ecology. Spatial Ecology focuses on some important emerging challenges in the field. These challenges consist of understanding the impact of space on community structure, incorporating the scale and structure of landscapes into mathematical models and developing connections between spatial ecology.

Mathematical Modelling of Environmental and Ecological Systems J. B. Shukla, 1987 This volume contains a cross section of the papers presented at the International Symposium on Mathematical Modelling of Ecological, Environmental and Biological Systems held in Kanpur, India in August 1985. The choice of topics emphasizes many aspects of ecological and environmental matters including air and water pollution, ecotoxicology, resource management, epidemiology and population and community ecology. It is intended that this volume will focus international attention upon some problems in the ecological and environmental sciences that can be impacted by mathematical modelling and analysis.

Populations Armando Garsd,1979 **Individual-Based Models and Approaches In Ecology** Donald Lee DeAngelis,1992-08 Until fairly recently populations were handled as homogenized averages which made modeling feasible but which ignored the essential fact that in any population there is a great variety of individuals of different ages sizes and degrees of fitness Recently because of the increased availability of affordable computer power approaches have been developed which are able to recognize individual differences Individual based models are of great use in the areas of aquatic ecology terrestrial ecology landscape or physiological ecology terrestrial ecology landscape or physiological ecology and agriculture This book discusses which biological problems individual based models can solve as well as the models inherent limitations It explores likely future directions of theoretical development in these models as well as currently feasible management applications and the best mathematical approaches and computer languages to use The book also details specific applications to theory and management The American Naturalist ,2008 Linear and Nonlinear Deterministic Character-dependent Models with Time Delay in Population Dynamics Carlos Castillo-Chávez,1984 **Mathematical Models in Biology** Leah Edelstein-Keshet,1988 The major aim of this book is to present instances of interaction between two major disciplines biology and mathematics The goal has been that of addressing a fairly wide audience Biology students will find this text useful as a summary of modern mathematical methods currently used in modelling and furthermore applied mathematics students may benefit from examples of applications of mathematics to real life problems As little background as possible has been assumed throughout the book prerequisites are basic calculus so that undergraduate students as well as beginning graduate students will find most of the material accessible **Journal of Mathematical Biology** ,1990 Publishes papers in which mathematics is used to understand biological phenomena and mathematical papers which answer questions arising from models of biological phenomena *Behavioural Ecology* British Ecological Society. Symposium,1985 The links between ecology and the study of behaviour are explored in this symposium volume If evolution is a fitness maximizing process in which optimal behaviour strategies are selected for what are the consequences for populations These are just some of the questions tackled in these papers **Discrete and Continuous Dynamical Systems** ,2005
