Models And Analogies In Science:

Models and Analogies in Science Mary B. Hesse, 1963 **Scientific Models in Philosophy of Science** Daniela M. Bailer-Jones, 2009-09-13 Scientists have used models for hundreds of years as a means of describing phenomena and as a basis for further analogy In *Scientific Models in Philosophy of Science* Daniela Bailer Jones assembles an original and comprehensive philosophical analysis of how models have been used and interpreted in both historical and contemporary contexts Bailer Jones delineates the many forms models can take ranging from equations to animals from physical objects to theoretical constructs and how they are put to use She examines early mechanical models employed by nineteenth century physicists such as Kelvin and Maxwell describes their roots in the mathematical principles of Newton and others and compares them to contemporary mechanistic approaches Bailer Jones then views the use of analogy in the late nineteenth century as a means of understanding models and to link different branches of science She reveals how analogies can also be models themselves or can help to create them The first half of the twentieth century saw little mention of models in the literature of logical empiricism Focusing primarily on theory logical empiricists believed that models were of temporary importance flawed and awaiting correction The later contesting of logical empiricism particularly the hypothetico deductive account of theories by philosophers such as Mary Hesse sparked a renewed interest in the importance of models during the 1950s that continues to this day Bailer Jones analyzes subsequent propositions of models as metaphors Kuhn's concept of a paradigm the Semantic View of theories and the case study approaches of Cartwright and Morrison among others She then engages current debates on topics such as phenomena versus data the distinctions between models and theories the concepts of representation and realism and the discerning of falsities in models **The Role of Analogy, Model, and Metaphor in Science** W. H. Leatherdale, 1974 **Models and Analogies in Science** Martin M. Forces and Fields M. Sc Ph. D. Mary B. Hesse,1961 Forces and Fields by Mary Hesse is a history of physics surrounding the question How do bodies act on one another across space Hesse illustrates this through various answers discussing period of transition in fundamental physics in which new concepts and ideas have been introduced and made scientifically testable and makes a certain philosophical interpretation of science from the beginning Some topics include the logical status of theories primitive analogies mechanism in Greek science the Greek inheritance Corpuscular Philosophy The Theory of Gravitation and The Theory of Relativity as well as others Mary B Hesse born 1924 was a contemporary English philosopher of science She is now professor emerita of the philosophy of science at Cambridge University Her publication Models and Analogies in Science is a widely cited and accessible introduction to the topic Hesse argues contra Duhem that models and analogies are integral to understanding scientific practice in general and scientific advancement in particular especially how the domain of a scientific

theory is extended and how theories generate genuinely novel predictions Examples of such models include the famous billiard ball model of the dynamical theory of gases and models of light based on analogies to sound and water waves Hesse thinks that in order help us understand a new system or phenomenon we will often create an analogical model that compares this new system or phenomenon with a more familiar system or phenomenon In her book Hesse makes a distinction between three types of analogues in scientific models positive analogies negative analogies and neutral analogies Positive analogies are those features which are known or thought to be shared by both systems negative analogies are those features which are known or thought to be present in one system but absent in the other and neutral analogies are those features whose status as positive or negative analogies is uncertain at present Neutral analogies are by far the most interesting of the three types of analogies for they suggest ways to test the limits of our models guiding the way for scientific advancement In the late 19th century for example the idea that light waves have a physical medium called the luminiferous ether would have been best thought of as a neutral analogy with water and sound waves Eventually due to a null result in the Michelson Morley and Trouton Noble experiments as well as other similar experiments this analogy came to be accepted as a negative analogy we now accept that light has no physical medium unlike sound and water waves The discovery of this negative analogy led to further advancement including the unification of electro magnetic theory with optics and the eventual creation of new and more informative models of light
