## **Model Based Computer Vision:**

Model-based Computer Vision Rodney Allen Brooks, 1984  
Gunnar Rutger Grape, Stanford University. Computer Science Department, 1973 A system for computer vision is presented which is based on two dimensional prototypes and which uses a hierarchy of features for mapping purposes More specifically one is dealing with scenes composed of planar faced convex objects Extensions to the general planar faced case are discussed The visual input is provided by a TV camera and the problem is to interpret that input by computer as a projection of a three dimensional scene The system proposed and demonstrated in this paper uses perspective consistent two dimensional models prototypes of views of three dimensional objects and interpretations of scene representations are based on the establishment of mapping relationships from conglomerates of scene elements line constellations to prototypes templates The prototypes are learned by the program through analysis of and generalization on ideal instances Modified author abstract

*A learning-based computer vision approach for the inference of articulated motion* Cristóbal Curio, 2012-02-13 Computer vision approaches to human motion analysis have received considerable attention from different research areas over the past couple of years The strong interest is largely due to their various applications in surveillance driver assistance systems human computer interfaces marker less motion capture biomedical engineering and computer graphics This thesis investigates the computational integration of different visual representations for the detection of human bodies and the analysis of their movements in both indoor and unconstrained outdoor environments New image coding schemes are presented in combination with methods from machine learning and dynamic filtering to address issues of complexity robustness and generalization
