

Developing an Integrated Modeling Tool for River Water Quality Index Assessment

Y.C. Lai¹, C.C. Chien², Z.H. Yang¹, Rao Y. Surampalli³, C.M. Kao^{1*}

ABSTRACT: The goal of this study was to establish a modeling tool for river water quality with a direct linkage to the water quality index (WQI) calculation and the river water quality model, the Water Quality Analysis Simulation Program (WASP), for pollutant transport modeling. The integrated WASP and WQI tool was field-tested to assess pollutant loadings and their impacts on river environment. Suspended solid (SS) and electric conductivity (EC) correlation equations and the WQI calculation tool were included in the water quality model and direct WQI calculation. The SS concentration, which was influenced by river flows, had crucial effects on river water quality and WQI values. EC value was controlled by dissolution of soil minerals, which was affected by the watershed drainage area and surface runoff. The integrated system could establish a direct correlation for river water quality, river flow, and WQI. *Water Environ. Res.*, 89, 260 (2017).

KEYWORDS: ammonia, electric conductivity (EC), River Water Quality, Suspended Solid (SS), Water Quality Index (WQI).

Introduction

Non-Point Sources (NPS) Pollution and Modeling. NPS of diffuse pollution imply sources of pollution that are diffused and do not have a point of origin or that are not introduced into a receiving water body from a specific outlet (Shrestha et al., 2008; Niraula et al., 2013). Agriculture, forest, mining, construction, and atmospheric deposition may contribute to NPS or diffuse pollution. Several factors, such as rainfall duration and intensity, site specific soil type, land use and management practices, and topography, typically affect the

extent of NPS pollution (Makundani et al., 2013; Wu et al., 2013). Different river models have been applied by local governments for river water quality simulation (Lu et al., 2013; Guo et al., 2014; Huang et al., 2014; Shen et al., 2015).

The U.S. Environmental Protection Agency (EPA) developed the Water Quality Simulation Program (WASP) for river water modeling (Yang et al., 2012). The Taiwan Environmental Protection Administration (TEPA) adopted the WASP in late 1990 for river and surface water management (Chen et al., 2012). WASP has been actively applied to the water quality simulation (Ambrose et al., 2001). WASP has been used to simulate pollutant content in different rivers in Taiwan (Chen et al., 2012). Researchers applied WASP for total maximum daily loads calculation and strategy development for the Da-Han River (Chen et al., 2013). Yang et al. (2012) evaluated the carrying capacity and pollutant loading for the Love River, and pollutant control strategies were developed using the calculated carrying capacity. There are also some applications worldwide using WASP (Naseer et al., 2014; Gerald et al., 2015). However, the linkage between the WASP model and the index of water quality for immediate and direct assessment of water quality from the regulation compliance point of view was not available.

Water Quality Index (WQI). The National Sanitation Foundation (NSF) of the USA developed the WQI for water quality evaluation in 1970 (Marta et al., 2010). The Delphi Technique method was applied by NSF-WQI to determine the most important and critical parameters. The most determinant parameters were selected by water quality experts after selecting from more than one hundred parameters. Thus, the variables in NSF-WQI are representative and could reflect the water quality variations in a target river. Nine water quality indicators were selected and included for water quality assessment, including temperature, turbidity, biochemical oxygen demand (BOD), fecal coliform, pH, nitrate, dissolved oxygen (DO), phosphate, and total solids (Marta et al., 2010; Chen et al., 2013; Ma et al., 2013; Sharma et al., 2013).

TEPA has developed the WQI index based on the NSF-WQI classification system for river water quality assessment in Taiwan (TEPA, 2002). The water quality parameters used for WQI development involve five parameters including DO, BOD,
