Modern Approaches In Forest Ecosystem Modelling:

Modern Approaches in Forest Ecosystem Modelling Oleg G. Chertov, Alexander S. Komarov, Georgy P. Karev, 2024-01-15
A review of modern approaches existing nowadays in ecological modelling of forest ecosystems in boreal and temperate forests. The book contains data on contemporary approaches in intensively developed simulation modelling of forest stands, soils and whole ecosystems, as well as an analysis of existing spatial forest models and their significance and development, and a comprehensive discussion of theoretical analytical models of forest communities. The idea of a system of forest models for more effective solving of different theoretical and practical problems is also discussed. This work is particularly useful in its critical reviewing of modern achievements in forest ecosystem modelling and its discussion of more promising trends of forest modelling with an increase of their practical significance in the near future.

Modern Approaches in Forest Ecosystem Modelling Oleg Georgievich Chertov, Aleksandr Sergeevich Komarov, Georgy P. Karev, 1999
A critical review of modern approaches in simulation spatial and theoretical analytical mathematical modelling of forest stands, soils and ecosystems with special reference to more promising trends of forest modelling and its practical and theoretical significance in ecologically oriented forestry of the next century.

New Developments in Ecology Research A. R. Burk, 2006
Ecology is the study of the interrelationships between organisms and their environment including the biotic and abiotic components. There are at least six kinds of ecology: ecosystem, physiological, behavioural, population and community. Specific topics include: Acid Deposition, Acid Rain Revisited, Biodiversity, Biocomplexity, Carbon Sequestration in Soils, Coral Reefs, Ecosystem Services, Environmental Justice, Fire Ecology, Floods, Global Climate Change, Hypoxia and Invasion. This new book presents new research on ecology from around the world.

Forecasting Forest Futures Hamish Kimmins, Juan A. Blanco, 2010-09-23
Modelling is an important tool for understanding the complexity of forest ecosystems and the variety of interactions of ecosystem components, processes and values. This book describes the hybrid approach to modelling forest ecosystems and their possible response to natural and management induced disturbance. The book describes the FORECAST family of ecosystem management models at three different spatial scales: tree stand, landscape and compares them with alternative models at these three spatial scales. The book will help forest managers to understand what to expect from ecosystem based forest models. These models serve as a tool for use in teaching about sustainability, scenario analysis and value trade offs in natural resources management and assist policy makers, managers and researchers working in assessment of sustainable forest management and ecosystem management. Several real life examples of using the FORECAST family of models in forest management and other applications are presented from countries including Canada, China, Spain and the USA to illustrate the concepts described in the text. The book also demonstrates how these models can be extended for scenario and value trade off analysis through visualization and educational or management games.

Environmental Modelling John Wainwright, Mark Mulligan, 2013-01-22
Simulation models are an established method used to investigate processes and solve

practical problems in a wide variety of disciplines Central to the concept of this second edition is the idea that environmental systems are complex open systems The authors present the diversity of approaches to dealing with environmental complexity and then encourage readers to make comparisons between these approaches and between different disciplines

Environmental Modelling Finding Simplicity in Complexity 2nd edition is divided into four main sections An overview of methods and approaches to modelling State of the art for modelling environmental processes Tools used and models for management Current and future developments The second edition evolves from the first by providing additional emphasis and material for those students wishing to specialize in environmental modelling This edition Focuses on simplifying complex environmental systems Reviews current software tools and techniques for modelling Gives practical examples from a wide variety of disciplines e g climatology ecology hydrology geomorphology and engineering Has an associated website containing colour images links to WWW resources and chapter support pages including data sets relating to case studies exercises and model animations This book is suitable for final year undergraduates and postgraduates in environmental modelling environmental science civil engineering and biology who will already be familiar with the subject and are moving on to specialize in the field It is also designed to appeal to professionals interested in the environmental sciences including environmental consultants government employees civil engineers geographers ecologists meteorologists and geochemists

Mechanisms of Forest Ecosystems Sustainability in a Changing Climate Erland G. Kolomyts, 2024-09-16 The author's working concept of geo ecological monitoring is presented For the first time the full triad of monitoring in its classical definition is considered observation state assessment control prediction management adaptation feedback regulation The strategic goal of described monitoring research is to reveal the environmental potential of sustainability of forest ecosystems in the context of modern global warming The monograph expounds the main statements of author's topographical predictive concept Global Changes on the Local Level as a basis of ground biogeological and geosystem monitoring of natural ecosystems under global anthropogenic climatic changes This concept makes it possible to carry out local empirical simulation of the regional bioclimatic trend and thereby reveal the mechanisms of transmission of global and regional climate signals to the local level On the example of the Volga River basin predictive empirical statistical models of the carbon balance of forest ecosystems are presented under conditions of a changing climate The carbon content in various pools of boreal and nemoral forests were calculated The global climate models give prognostic estimates of the components of them carbon balance A quantitative assessment of the ecological resources of forest formations that provide the environment sustainability through mechanisms of regulation of the carbon cycle is given The adaptation of forest ecosystems to climate change is described through the calculated parameters of their functional sustainability

Quantitative Methods in Landscape Ecology Monica G. Turner,Robert H. Gardner,1991 Landscape ecology as a modern interdisciplinary science is making use increasingly of quantitative research techniques adopted from other fields So far no synthetic reference has been available to those wishing to acquaint themselves with new approaches to quantitative analysis of spatial heterogeneity at the landscape level This book seeks to meet this need by providing a conceptual framework and illustrating potential applications for methods such as pattern analysis spatial statistics fractals modeling broad scale studies and extrapolation across scales Each technique is discussed in sufficient detail to be adaptable to a variety of research problems **Quantitative Methods in Landscape Ecology** will be an important resource for researchers and students of landscape and ecosystem ecology in understanding and analyzing the dynamics of complex spatial systems
