

- 1 A student carries out an experiment using the **potometer** shown and an electric fan, which is set at different powers.

The results are shown in the table below.

Fan power setting (W)	Distance moved by bubble in five minutes (mm)		
	Trial 1	Trial 2	Trial 3
10	22	27	26
15	35	36	34
20	42	44	49
25	55	57	56

- Calculate the mean values of the repeated readings.
- Calculate the mean rate of **transpiration** for each power setting.
- Draw a graph to show the linear relationship between the fan power and the rate of transpiration. The linear relationship shown by the line of best fit can be represented as $y = mx + c$.
- Calculate the slope (gradient) of the line (m).
- What is the value of c , the y -intercept? This will give you an estimation of the rate of transpiration without air movement.
- Calculate the rate of transpiration at a power setting of 12 W.
- Explain why increasing the fan power setting increases the rate of transpiration.

- 2 The drawing shows the cells used for transpiration.

- Explain how transpiration occurs.
- State the name of these cells.
- Explain one way in which the cells are adapted for transpiration.
- State two ways in which the structure of these cells is different to that of those used for **translocation**.
- State the major sugar transported in translocation.

Extra challenge

- 1 The volume of a cylinder is calculated using this equation: $V = \pi r^2 h$

where V is the volume

π is pi (which is equal to about 3.142, but you should use the π button on your calculator)

r is the radius and h is the height (or length).

Use the equation to calculate the rates of transpiration in question 1 in units of mm^3 of water per minute. The diameter of the potometer tube is 1.3 mm.
