Shell Structures: Theory and Applications Wojciech Pietraszkiewicz, Jaroslaw Gorski, 2013-09-18 Shells are basic structural elements of modern technology and everyday life. Examples are automobile bodies, water and oil tanks, pipelines, aircraft fuselages, nanotubes, graphene sheets, or beer cans. Also, nature is full of living shells such as leaves of trees, blooming flowers, seashells, cell membranes, the double helix of DNA, or wings of insects. In the human body, arteries, the shell of the eye, the diaphragm, the skin, or the pericardium are all shells as well. *Shell Structures: Theory and Applications*, Volume 3, contains 137 contributions presented at the 10th Conference *Shell Structures: Theory and Applications* held October 16-18, 2013, in Gdansk, Poland. The papers cover a wide spectrum of scientific and engineering problems, which are divided into seven broad groups: general lectures, theoretical modelling, stability, dynamics, bioshells, numerical analyses, and engineering design. The volume will be of interest to researchers and designers dealing with modelling and analyses of shell structures and thin-walled structural elements.

Revival: Nonlinear Analysis of Structures (1997) Muthukrishnan Sathyamoorthy, 2017-11-22 *Nonlinear Analysis of Structures* presents a complete evaluation of the nonlinear static and dynamic behavior of beams, rods, plates, trusses, frames, mechanisms, stiffened structures, sandwich plates, and shells. These elements are important components in a wide variety of structures and vehicles such as spacecraft and missiles, underwater vessels and structures, and modern housing. Today's engineers and designers must understand these elements and their behavior when they are subjected to various types of loads. Coverage includes the various types of nonlinearities, stress-strain relations, and the development of nonlinear governing equations derived from nonlinear elastic theory. This complete guide includes both mathematical treatment and real-world applications with a wealth of problems and examples to support the text. Special topics include a useful and informative chapter on nonlinear analysis of composite structures and another on recent developments in symbolic computation. Designed for both self-study and classroom instruction, *Nonlinear Analysis of Structures* is also an authoritative reference for practicing engineers and scientists. One of the world's leaders in the study of nonlinear structural analysis, Professor Sathyamoorthy has made significant research contributions to the field of nonlinear mechanics for twenty-seven years. His foremost contribution to date has been the development of a unique transverse shear deformation theory for plates undergoing large amplitude vibrations and the examination of multiple mode solutions for plates. In addition to his notable research, Professor Sathyamoorthy has also developed and taught courses in the field at universities in India, Canada, and the United States.

Advances in the Mechanics of Plates and Shells D. Durban, Dan Givoli, J.G. Simmonds, 2001-11-30 The optimal control of flexible structures is an active area of research. The main body of work in this area is concerned with the control of time-dependent displacements and stresses and assumes linear elastic conditions, namely linear elastic material behavior and small deformation. See e.g. 1-3 the collections of papers 4-5 and references therein. On the other hand, in the

present paper we consider the static optimal control of a structure made of a nonlinear elastic material and undergoing large deformation. An important application is the suppression of static or quasi static elastic deformation in flexible space structures such as parts of satellites by the use of control loads. Solar radiation and radiation from other sources induce a temperature field in the structure which in turn generates an elastic displacement field. The displacements must usually satisfy certain limitations dictated by the allowed working conditions of various orientation sensitive instruments and antennas in the space vehicle. For example a parabolic reflector may cease to be effective when undergoing large deflection. The elastic deformation can be reduced by use of control loads which may be implemented via mechanically based actuators or more modern piezoelectric devices. When the structure under consideration is made of a rubber like material and is undergoing large deformation nonlinear material and geometric effects must be taken into account in the analysis.
