Function Spaces and Operators between them José Bonet,David Jornet,Pablo Sevilla-Peris,2023-10-28 The aim of this work is to present in a unified and reasonably self contained way certain aspects of functional analysis which are needed to treat function spaces whose topology is not derived from a single norm their topological duals and operators between those spaces We treat spaces of continuous analytic and smooth functions as well as sequence spaces Operators of differentiation integration composition multiplication and partial differential operators between those spaces are studied A brief introduction to Laurent Schwartz s theory of distributions and to Lars H rmander s approach to linear partial differential operators is presented The novelty of our approach lies mainly on two facts First of all we show all these topics together in an accessible way stressing the connection between them Second we keep it always at a level that is accessible to beginners and young researchers Moreover parts of the book might be of interest for researchers in functional analysis and operator theory Our aim is not to build and describe a whole complete theory but to serve as an introduction to some aspects that we believe are interesting We wish to guide any reader that wishes to enter in some of these topics in their first steps Our hope is that they learn interesting aspects of functional analysis and become interested to broaden their knowledge about function and sequence spaces and operators between them The text is addressed to students at a master level or even undergraduate at the last semesters since only knowledge on real and complex analysis is assumed We have intended to be as self contained as possible and wherever an external citation is needed we try to be as precise as we can Our aim is to be an introduction to topics in or connected with different aspects of functional analysis Many of them are in some sense classical but we tried to show a unified direct approach some others are new This is why parts of these lectures might be of some interest even for researchers in related areas of functional analysis or operator theory There is a full chapter about transitive and mean ergodic operators on locally convex spaces This material is new in book form It is a novel approach and can be of interest for researchers in the area   The Structure of Functions Hans Triebel,2012-12-13 This book deals with the constructive Weierstrassian approach to the theory of function spaces and various applications The first chapter is devoted to a detailed study of quarkonial subatomic decompositions of functions and distributions on euclidean spaces domains manifolds and fractals This approach combines the advantages of atomic and wavelet representations It paves the way to sharp inequalities and embeddings in function spaces spectral theory of fractal elliptic operators and a regularity theory of some semi linear equations The book is self contained although some parts may be considered as a continuation of the author s book Fractals and Spectra It is directed to mathematicians and theoretical physicists interested in the topics indicated and in particular how they are interrelated The book under review can be regarded as a continuation of his book on Fractals and spectra 1997 There are many sections named comments preparations motivations discussions and so on These parts of the book seem to be very interesting and valuable They help the reader to deal with the main course Mathematical Reviews   **Linear**
